**G - 57**

**G - 57 A. Gaziyev, I. Israilov, M. Yaxshiboyev. Matematik analizdan misol va masalalar, 2-qism (o'quv qo'llanma). –T.: «Fan va texnologiya», 2012, 384 b.**

Ushbu qo'llanma matematik analizning aniqmas integrallar, aniq integrallar va ularning tadbiqlari hamda ko'p o'zgaruvchili funksiyalar mavzulari bo'yicha talabalarda misol va masalalarni mustaqil yechish ko'nikmasini hosil qilishga mo'ljallangan.

Qo'llanmaning har bir paragrafida, avvalo, mavzuning nazariy qismidan qisqacha axborot berilgan, so'ngra mavzuga mos tipik misol va masalalar batafsil yechib ko'rsatilgan hamda mustaqil ishlash uchun yetarli miqdorda misol va masalalar javoblari bilan berilgan.

O'quv qo'llanma bakalavriatning «matematika», «mexanika», «amaliy matematika va informatika», «fizika» va texnika yo'nalishlarining «Oliy matematika» chuqurlashtirilgan dastur asosida o'qitiladigan talabalari hamda o'qituvchilar uchun mo'ljallangan.

## SO‘Z BOSHI

Mazkur qo‘llanma «Matematik analiz» fani bo‘yicha o‘quv-uslubiy majmuuning tarkibiy qismlaridan biri bo‘lib, unda matematik analizning aniqmas integrallar, aniq integrallar va ularning tadbiqlari hamda ko‘p o‘zgaruvchili funksiyalar bo‘limlari bo‘yicha asosiy tushunchalar keltirilgan.

O‘quv qo‘llanma to‘rt bobdan iborat. Birinchi bobda boshlang‘ich funksiya va aniqmas integral qaralgan hamda integrallash usullarining barchasi ohib berilgan. Qo‘llanmaning ikkinchi bobni aniq integral, uni hisoblash usullari bo‘yicha mavzularni o‘z ichiga olgan. Uchinchi bobda aniq integralning fizika, mexanika, iqtisodiyot kabi sohalarda uchraydigan masalalarning yechilishiga tadbiqlari qaralgan. Oxirgi, to‘rtinchini bobda  $R^n$  fazo, ko‘p o‘zgaruvchili funksiyalar, ularning limiti, uzlusizligi, xususiy hosilalari, differensiallari, yuqori tartibli xususiy hosilalari, ekstrimumlari qaralgan.

O‘z navbatida, har bir bob tegishli paragraflarga bo‘lingan bo‘lib, har bir paragraf mavzuga taalluqli asosiy ta’riflar, tasdiqlar, teoremlarni o‘z ichiga oladi, shuningdek, ularning har biri an‘anaviy misollarni bat afsil tahlil yordamida yechish orqali namoyish qilingan. Qo‘llanmada jami 198 ta misol va masalalar yechilgan, 1566 ta mustaqil yechish uchun misol va masalalar tavsiya qilingan hamda ularning javoblari berilgan. Hozirgi vaqtida amaliyotda bir necha yaxshi rivojlangan matematik dasturlar (Mathcad, Maple, Mathematica, Mathlab va h.k.) matematik masalalarni kompyuter imkoniyatlaridan foydalanib yechishda samarali natijalar bermoqda. Shu an‘anadan chetda qolmaslik uchun, qo‘llanmada ba‘zi bo‘limlar bo‘yicha misol va masalalar yechishda «Maple» tizimining qo‘llanishi va uning qulayliklari namoyish etilgan.

Ushbu qo‘llanmani yozishga mualliflarni undagan narsa, ularning ko‘p yillar mobaynida Samarqand davlat universitetida matematik analiz kursidan olib borgan ma’ruza va amaliy mashg‘ulotlarida orttirgan tajribasi natijasidir. O‘ylaymizki, qo‘llanma o‘z o‘quvchilarini topadi va boshqa mavjud o‘quv adabiyotlari qatorida matematik analiz kursining aytib o‘tilgan bo‘limlari bo‘yicha ularga bilimlarini oshirishga ko‘mak beradi.

O‘quv qo‘llanma haqidagi fikr-mulohazalar, undagi mavjud kamchiliklar bo‘yicha takliflarni mualliflar mammuniyat bilan qabul qiladilar.

## I bob. ANIQMAS INTEGRALLAR

**1-§. Boshlang'ich funksiya, aniqmas integral tushunchalari.**  
**Aniqmas integralning sodda xossalari. Aniqmas integrallar jadvali.**

**1.1. Boshlang'ich funksiya tushunchasi. Aniqmas integral.** Harakat boshlangandan o'tgan  $t$  vaqt ichida moddiy nuqta  $s(t)$  yo'l o'tgan bo'lsin, u holda,  $v(t)$  oniy tezlik,  $s(t)$  funksiyaning hosilasiga teng, ya'ni  $v(t) = s'(t)$ . Amaliyotda teskari masala ham uchraydi: moddiy nuqtaning  $v(t)$  harakat tezligi berilganda, uning bosib o'tgan  $s(t)$  yo'lini toping. Amaliyotdagi bunday masala,  $f(x)$  funksiyaning *boshlang'ich funksiyasi* tushunchasiga olib keladi.

$f(x)$  va  $F(x)$  funksiyalar biror  $x$  (ochiq yoki yopiq: chekli yoki cheksiz) oraliqda aniqlangan bo'lib, ular

$$F'(x) = f(x) \quad (1.1)$$

munosabatda bo'lsin.

**1.1-ta'rif.** Agar  $F(x)$  funksiya biror  $x$  oraliqda differensiallanuvchi bo'lib,  $\forall x \in X$  lar uchun (1.1) tenglik o'rinni bo'lsa, u holda  $F(x)$  funksiyada  $x$  oraliqda  $f(x)$  funksiyaning *boshlang'ich funksiyasi* deyiladi.

**1.2-ta'rif.** Agar  $f(x)$  va  $F(x)$  funksiyalar  $X = [a; b]$  kesmada aniqlangan va  $\forall x \in (a, b)$  uchun  $F'(x) = f(x)$  yoki  $dF(x) = f(x)dx$  bo'lib,  $a$  va  $b$  nuqtalarda  $F'(a+0) = f(a)$ ,  $F'(b-0) = f(b)$  tengliklar o'rinni bo'lsa, u holda,  $F(x)$  funksiyaga  $X = [a; b]$  kesmada  $f(x)$  funksiyaning *boshlang'ich funksiyasi* deyiladi.

**1.1-teorema.** Agar  $F(x)$  va  $\Phi(x)$  funksiyalar  $X$  oraliqda differensiallanuvchi bo'lib, ularning har biri  $f(x)$  funksiyaning  $X$  oraliqdagi boshlang'iya funksiysi bo'lsa, u holda,  $F(x)$  va  $\Phi(x)$  funksiyalar  $X$  da bir-biridan o'zgarmas songa farq qiladi, ya'ni

$$\Phi(x) = F(x) + C, \quad x \in X.$$

Agar  $f(x)$  funksiyaning  $X$  oraliqda biror  $F(x)$  boshlang'ich funksiyasi ma'lum bo'lsa, uning boshqa istalgan boshlang'ich funksiya  $F(x) + C$  formula orqali topiladi.

**1.3-ta'rif.**  $f(x)$  funksiyaning  $x$  oraliqdagi barcha boshlang'ich funksiyalar to'plamiga,  $f(x)$  funksiyaning *aniqmas integrali* deyiladi va u  $\int f(x) dx$

kabi belgilanadi, bunda  $\int$  - integral belgisi,  $f(x)$  - integral ostidagi funksiya,  $f(x)dx$  esa, - *integral ostidagi ifoda deyiladi*.

Agar  $F(x)$  funksiya  $x$  oraliqda  $f(x)$  funksiyaning biror boshlang'ich funksiyasi bo'lsa, u holda  $f(x)$  funksiyaning aniqmas integrali

$$\int f(x) dx = F(x) + C \quad (C - \text{ixtiyoriy o'zgarmas son})$$

yoki

$$\int f(x) dx = \{F(x) + C\}$$

kabi yoziladi.

**1.1-misol.** Berilgan oraliqda berilgan  $F(x)$  funksiya berilgan  $f(x)$  funksiyaning boshlang'ich funksiyasi ekanligini ko'rsating va aniqmas integralini yozing:

$$1), \quad F(x) = \frac{x^4}{4}, \quad f(x) = x^3, \quad X = (-\infty, \infty) = R;$$

$$2) \quad F(x) = \frac{\sin ax}{a}, \quad f(x) = \cos ax \quad (a = \text{const}), \quad X = (-\infty, \infty) = R;$$

$$3) \quad F(x) = \sqrt{1-x^2}, \quad f(x) = -\frac{x}{\sqrt{1-x^2}}, \quad X = (-1; 1);$$

$$4) \quad F(x) = \frac{2}{3}\sqrt{x^3}, \quad f(x) = \sqrt{x}, \quad X = (0; \infty);$$

$$5) \quad F(x) = \sqrt{x} - \cos(x+1), \quad f(x) = \frac{1}{2\sqrt{x}} + \sin(x+1), \quad X \in (0; +\infty).$$

**Yechilishi.** 1)  $f(x) = x^3$  funksiyaning  $X = (-\infty, \infty) = R$  oraliqdagi boshlang'ich funksiyasi  $F(x) = \frac{x^4}{4}$  bo'ladi, chunki  $F'(x) = \left(\frac{x^4}{4}\right)' = x^3$ .

$$\text{Demak, } \int x^3 dx = \frac{x^4}{4} + C.$$

2)  $f(x) = \cos ax \quad (a = \text{const})$  funksiyaning  $R$  dagi boshlang'ich funksiyasi  $F(x) = \frac{\sin ax}{a}$  bo'ladi, chunki  $F'(x) = \left(\frac{\sin ax}{a}\right)' = \cos ax = f(x)$ . Demak,

$$\int \cos ax dx = \frac{\sin ax}{a} + C.$$

3)  $f(x) = -\frac{x}{\sqrt{1-x^2}}$  funksiyaning  $X = (-1; 1)$  oraliqdagi boshlang'ich funksiyasi  $F(x) = \sqrt{1-x^2}$  bo'ladi, chunki  $F'(x) = (\sqrt{1-x^2})' = -\frac{x}{\sqrt{1-x^2}} = f(x)$ .

Demak,  $\int \frac{-x}{\sqrt{1-x^2}} dx = \sqrt{1-x^2} + C$ .

4)  $f(x) = \sqrt{x}$  funksiyaning  $X = (0; \infty)$  oraliqdagi boshlang'ich funksiyasi  $F(x) = \frac{2}{3}\sqrt{x^3}$  bo'ladi, chunki  $F'(x) = \left(\frac{2}{3}\sqrt{x^3}\right)' = \sqrt{x} = f(x)$ . Demak,

$$\int \sqrt{x} dx = \frac{2}{3}\sqrt{x^3} + C.$$

5)  $f(x) = \frac{1}{2\sqrt{x}} + \sin(x+1)$  funksiyaning  $X \in (0; +\infty)$  oraliqdagi boshlang'ich funksiyasi  $F(x) = \sqrt{x} - \cos(x+1)$  dan iborat bo'ladi, chunki  $F'(x) = (\sqrt{x} - \cos(x+1))' = \frac{1}{2\sqrt{x}} + \sin(x+1) = f(x)$ .

Demak,  $\int \left( \frac{1}{2\sqrt{x}} + \sin(x+1) \right) dx = \sqrt{x} - \cos(x+1) + C$ .

**1.2-misol.**  $f(x)$  funksiyaning, grafigi berilgan  $A(x_0, y_0)$  nuqta orqali o'tadigan, boshlang'ich funksiyasini toping.

$$1) f(x) = x^3, A(2; 2); \quad 2) f(x) = \sin x + \frac{8}{\pi^2}x, A\left(\frac{\pi}{2}; 3\right).$$

**Yechilishi.** 1)  $f(x) = x^3$  funksiyaning  $X = (-\infty, \infty) = R$  oraliqdagi boshlang'ich funksiyasi  $F(x) = \frac{x^4}{4} + C$  dan iborat bo'ladi, chunki  $F'(x) = \left(\frac{x^4}{4} + C\right)' = x^3 = f(x)$ . Endi  $C$  o'zgarmas sonni topamiz.  $F(x) = \frac{x^4}{4} + C$  funksiyaning grafigi  $A(2; 2)$  nuqtadan o'tsin.  $x=2, y=2$  larni  $F(x)$  va  $x$  larning o'rniga qo'yib,  $2 = \frac{2^4}{4} + C$  tenglikni hosil qilamiz, bunda  $C = -2$ . Demak,  $F(x) = \frac{x^4}{4} - 2$ .

2)  $f(x) = \sin x + \frac{8}{\pi^2}x$  funksiyaning  $X = (-\infty, \infty) = R$  oraliqdagi boshlang'ich funksiyasi  $F(x) = -\cos x + \frac{4}{\pi^2}x^2 + C$  dan iborat bo'ladi, chunki  $F'(x) = (-\cos x + \frac{4}{\pi^2}x^2 + C)' = \sin x + \frac{8}{\pi^2}x = f(x)$ .  $F(x) = -\cos x + \frac{4}{\pi^2}x^2 + C$  funksiyaning grafigi  $A\left(\frac{\pi}{2}; 3\right)$  nuqtadan o'tsin.  $x = \frac{\pi}{2}, y = 3$  larni  $F(x)$  ning ifodasiga qo'yib,  $3 = -\cos \frac{\pi}{2} + \frac{4}{\pi^2} \left(\frac{\pi}{2}\right)^2 + C$  ni hosil qilamiz, bunda  $C = 2$ .

$$\text{Demak, } F(x) = -\cos x + \frac{4}{\pi^2}x^2 + 2.$$

## 1.2. Aniqmas integralning asosiy xossalari. Elementar funksiyalarning aniqmas integrallari jadvali.

1<sup>0</sup>.  $f(x)$  funksiya  $x$  oraliqda boshlang'ich funksiyaga ega bo'lsa, u holda,  $\forall x \in X$  uchun

$$d\left(\int f(x)dx\right) = f(x)dx \quad (1.2)$$

tenglik o'rini bo'ladi, ya'ni differensial belgisi  $d$ , integral belgisi  $\int$  dan oldin kelganda  $d$  va  $\int$  belgilari o'zaro qisqarib integral ostidagi ifodaga teng bo'ladi;

2<sup>0</sup>. Funksiya differensialining aniqmas integrali, shu funksiya bilan o'zgarmas sonning yig'indisiga teng, ya'ni

$$\int dF(x) = F(x) + C \quad yoki \quad \int F'(x)dx = F(x) + C \quad (C = const) \quad (1.3)$$

tenglik o'rini bo'ladi, ya'ni  $\int$  integral belgisi,  $d$  differensial belgisidan oldin kelganda,  $\int$  va  $d$  belgilari o'zaro qisqaradi, lekin bu holda,  $F(x)$  funksiyaga ixtiyoriy o'zgarmas son  $C$  ni qo'shish kerak.

3<sup>0</sup>. Agar  $f(x)$  va  $g(x)$  funksiyalar  $x$  oraliqda boshlang'ich funksiyalarga ega bo'lib,  $\lambda$  va  $\mu$  lar haqiqiy o'zgarmas sonlar bo'lsa, u holda  $\lambda f(x) + \mu g(x)$  funksiya ham shu oraliqda boshlang'ich funksiyaga ega bo'ladi, hamda

$$\int [\lambda f(x) + \mu g(x)]dx = \lambda \int f(x)dx + \mu \int g(x)dx \quad (1.4)$$

tenglik o'rini.

**1.2-eslatma.** (1.4) formuladagi tenglik, shartli ravishda, ya'ni tenglikning o'ng va chap tomonlari o'zaro ixtiyoriy o'zgarmas son aniqligida teng, deb qaraladi.

Sodda elementar funksiyalarning aniqmas integrallari jadvali qo'yidagichadir:

$$1. \int 0 \cdot dx = C.$$

$$2. \int 1 \cdot dx = x + C.$$

$$3. \int x^\alpha dx = \frac{x^{\alpha+1}}{\alpha+1} + C \quad (\alpha \neq -1).$$

$$4. \int \frac{1}{x} dx = \ln|x| + C \quad (x \neq 0).$$

$$5. \int a^x \cdot dx = \frac{a^x}{\ln a} + C, \quad 0 < a \neq 1, \quad \int e^x dx = e^x + C.$$

$$6. \int \sin x \, dx = -\cos x + C.$$

$$7. \int \cos x \, dx = \sin x + C.$$

$$8. \int \frac{1}{\cos^2 x} \, dx = \operatorname{tg} x + C \quad \left( x \neq \frac{\pi}{2} + n\pi, n = 0, \pm 1, \dots \right).$$

$$9. \int \frac{1}{\sin^2 x} \, dx = -\operatorname{ctg} x + C \quad (x \neq n\pi, n = 0, \pm 1, \dots).$$

$$10. \int \operatorname{sh} x \, dx = \operatorname{ch} x + C.$$

$$11. \int \operatorname{ch} x \, dx = \operatorname{sh} x + C.$$

$$12. \int \frac{1}{\operatorname{ch}^2 x} \, dx = \operatorname{th} x + C.$$

$$13. \int \frac{1}{\operatorname{sh}^2 x} \, dx = -\operatorname{cth} x + C.$$

$$14. \int \frac{dx}{x^2 + a^2} = \frac{1}{a} \operatorname{arctg} \frac{x}{a} + C = -\frac{1}{a} \operatorname{arcctg} \frac{x}{a} + C.$$

$$15. \int \frac{1}{x^2 - a^2} \, dx = \frac{1}{2a} \ln \left| \frac{x-a}{x+a} \right| + C.$$

$$16. \int \frac{dx}{\sqrt{a^2 - x^2}} = \arcsin \frac{x}{a} + C = -\arccos \frac{x}{a} + C, |x| < a.$$

$$17. \int \frac{1}{\sqrt{x^2 \pm a^2}} \, dx = \ln \left| x + \sqrt{x^2 \pm a^2} \right| + C, |x| > |a|.$$

Aniqmas integralning ta’rifi va xossalardan foydalanib, quyida berilgan ba’zi aniqmas integrallarni hisoblaymiz.

**1.3- misol.**  $\int x^2(x+2)(x-3) \, dx$  integralni hisoblang.

**Yechilishi.** Aniqmas integralning 3 – xossasi, hamda jadvaldagagi 3 – formulaga asosan:

$$\int x^2(x+2)(x-3) \, dx = \int (x^4 - x^3 - 6x^2) \, dx = \frac{x^5}{5} - \frac{x^4}{4} - 2x^3 + C \text{ bo‘ladi.}$$

**Tekshirish.** Topilgan boshlang‘ich funksiya hosislasining integral ostidagi funksiyaga teng yoki teng emasligini tekshirib ko‘ramiz:

$$\left( \frac{x^5}{5} - \frac{x^4}{4} - 2x^3 + C \right) = x^4 - x^3 - 6x^2 + 0 = x^2(x^2 - x - 6) = x^2(x+2)(x-3), \quad x \in R.$$

Demak, berilgan funksiyaniñ aniqmas integrali to‘g‘ri topilgan ekan.

**Misolni Maple tizimidan foydalanib yechish:**

> Int((x)^2\*(x+2)\*(x-3),x)=int((x)^2\*(x+2)\*(x-3),x);

$$\int x^2(x+2)(x-3) \, dx = \frac{x^5}{5} - \frac{x^4}{4} - 2x^3.$$

**1.4-misol.**  $\int \left( \frac{4}{x^3} - \frac{2}{x^2} + \frac{3}{x} \right) \, dx$  integralni hisoblang.

**Yechilishi.** Integral ostidagi funksiyaning aniqlanish sohasida, aniqmas integrallarning 3-xossasi hamda integrallar jadvalidagi 3 va 4-formulalarga asosan,

$$\int \left( \frac{4}{x^3} - \frac{2}{x^2} + \frac{3}{x} \right) dx = 4 \int x^{-3} dx - 2 \int x^{-2} dx + 3 \int \frac{1}{x} dx = -\frac{2}{x^2} + \frac{2}{x} + 3 \ln|x| + C, \quad x \neq 0$$

ekanligini topamiz.

**Tekshirish.** Topilgan boshlang'ich funksiya hosilasining integral ostidagi funksiyaga teng yoki teng emasligini tekshirib ko'ramiz:

$$\left( \frac{-2}{x^2} + \frac{2}{x} + 3 \ln|x| + C \right) = \frac{4}{x^3} - \frac{2}{x^2} + \frac{3}{x}. \quad \text{Demak, aniqmas integral to'g'ri topilgan.}$$

*Misolni Marle tizimidan foydalanib yechish:*

$$> \text{Int}(4*(x)^{(-3)}-2*(x)^{(-2)}+3/x,x)=\text{int}(4*(x)^{(-3)}-2*(x)^{(-2)}+3/x,x); \\ \int \frac{4}{x^3} - \frac{2}{x^2} + \frac{3}{x} dx = -\frac{2}{x^2} + \frac{2}{x} + 3 \ln(x).$$

$$1.5\text{-misol. } \int \frac{\sqrt{4+x^2} + 2\sqrt{4-x^2}}{\sqrt{16-x^4}} dx \text{ integralni hisoblang.}$$

**Yechilishi.** Integral ostidagi funksiyaning aniqlanish sohasida, aniqmas integralning 3 – xossasi, hamda integrallar jadvalidagi 16 va 17 formulalaridan foydalanib,

$$\begin{aligned} & \int \frac{\sqrt{4+x^2} + 2\sqrt{4-x^2}}{\sqrt{16-x^4}} dx = \\ & = \int \frac{1}{\sqrt{4-x^2}} dx + 2 \int \frac{1}{\sqrt{4+x^2}} dx = \arcsin \frac{x}{2} + \ln \left| x + \sqrt{x^2 + 4} \right| + C, \quad x \neq \pm 4 \end{aligned}$$

ekanligini topamiz.

**Tekshirish.** Topilgan boshlang'ich funksiya hosilasining integral ostidagi funksiyaga teng yoki teng emasligini tekshirib ko'ramiz:

$$\left( \arcsin \frac{x}{2} + 2 \ln \left| x + \sqrt{x^2 + 4} \right| + C \right) = \frac{1}{\sqrt{4-x^2}} + \frac{2(\sqrt{4+x^2} + x)}{(x+\sqrt{4+x^2}) \cdot \sqrt{x^2+4}} = \frac{\sqrt{x^2+4} - 2\sqrt{4-x^2}}{\sqrt{16-x^4}}.$$

Shunday qilib, integral ostidagi funksiyani hosil qildik, demak aniqmas integral to'g'ri topilgan.

$$1.6\text{-misol. } \int \operatorname{ctg}^2 x dx \text{ integralni hisoblang}$$

**Yechilishi.** Integral ostidagi funksiyaning aniqlanish sohasida, aniqmas integralning 3– xossasi va integrallar jadvalining 9 – formulasiga asosan:

$$\int \operatorname{ctg}^2 x dx = \int \left( \frac{1}{\sin^2 x} - 1 \right) dx = -\operatorname{ctgx} x - x + C, \quad x \in R \text{ bo'lishini topamiz.}$$

**Tekshirish.** Topilgan boshlang'ich funksiya hosilasining integral ostidagi funksiyaga teng yoki teng emasligini tekshirib ko'ramiz:

$$(-ctgx - x + C)' = \frac{1}{\sin^2 x} - 1 = ctg^2 x$$

Demak, aniqmas integral to‘g‘ri topilgan.

**1.7-misol.**  $\int \frac{2^x + 5^x}{10^x} dx$  integrallarni hisoblang

**Yechilishi.** Aniqmas integralning 3-xossasi va integrallar jadvalning 5- formulasidan foydalanib,

$$\int \frac{2^x + 5^x}{10^x} dx = \int \frac{1}{5^x} dx + \int \frac{1}{2^x} dx = \int 5^{-x} dx + \int 2^{-x} dx = -\frac{2^{-x}}{\ln 2} - \frac{5^{-x}}{\ln 5} + C, \quad x \in R,$$

bo‘lishini topamiz.

**Tekshirish.** Topilgan boshlang‘ich funksiya hosilasining integral ostidagi funksiyaga teng yoki teng emasligini tekshirib ko‘ramiz:

$$\left( -\frac{2^{-x}}{\ln 2} - \frac{5^{-x}}{\ln 5} + C \right) = \frac{1}{2^x} + \frac{1}{5^x} = \frac{2^x + 5^x}{10^x}$$

Demak, topilgan boshlang‘ich funksiyaning hosilasi integral ostidagi funksiyaga teng ekan.

### Mustaqil yechish uchun misollar

Quyidagi funksiyalarning bitta boshlang‘ich funksiyasini toping.

1.1.  $f(x) = 5x^4.$       1.2. 2)  $f(x) = \cos 2x.$       1.3. 3)  $f(x) = e^{1-3x}.$

1.4. 4)  $f(x) = ctg 3x.$       1.5. 5)  $f(x) = \frac{1}{\cos^2 3x} + 2^{3x}.$       1.6. 6)  $f(x) = \sqrt{x} + \sqrt[3]{x}.$

Berilgan oraliqda  $F(x)$  funksiya  $f(x)$  funksiyaning boshlang‘ich funksiyasi ekanligini ko‘rsating va aniqmas integralini yozing:

1.7. 1)  $f(x) = 2 - \frac{3}{\cos^2 3x}.$

1.8. 2)  $f(x) = ctg^2 5x.$

1.9. 3)  $f(x) = 3(3x+5)^4.$

1.10. 4)  $f(x) = \sin 2x \cdot \cos x.$

1.11. 5)  $f(x) = \left( \frac{\sin 2x - 2\sin^2 x}{1 - \cos x} \right)^3.$

1.12. 6)  $f(x) = \ln^{-1} x - \ln^{-2} x.$

$f(x)$  funksiyaning, grafigi berilgan  $A(x_0, y_0)$  nuqta orqali o‘tadigan, boshlang‘ich funksiyasini toping.

1.13. 1)  $f(x) = x^2,$        $A(3;2).$

1.14. 2)  $f(x) = \cos x + 2x,$        $A\left(\frac{\pi}{2}; 3\right).$

1.15. 3)  $f(x) = e^x + \sin 2x,$        $A\left(0; \frac{7}{2}\right).$

1.16. 4)  $f(x) = \frac{1}{x} + 2x,$        $A(e, 1).$

$$1.17.5) f(x) = 2 \cos^2 \frac{x}{2}, \quad A(0;3).$$

$$1.18.6) f(x) = e^{3+2x} - 4 \sin(2x+3), \quad A\left(\frac{-3}{2}, 0\right).$$

Agar  $F(x)$  funksiya  $f(x)$  funksiyaning boshlang'ich funksiyasi bo'lsa, berilgan funksiyaning boshlang'ich funksiyalarini toping.

## 2-§. Integrallash usullari

**2.1. O'zgaruvchilarni almashtirish usuli.** O'zgaruvchilarni almashtirish usuli aniqmas integralni hisoblashning eng muhim usullaridan biri bo'lib, unda hisoblash talab qilingan integral, hisoblash uchun qulay (oson) bo'lgan integralga almashtiriladi, u esa, quyidagi tasdiqqa asoslanadi:

$t = \varphi(x)$  funksiya biror  $x$  (interval yoki segment, yarim o'q yoki son o'qi) oraliqda aniqlangan va differensiallanuvchi bo'lib, uning qiymatlar to'plami  $T = \{t\}$  bo'lsin.  $T$  to'plamda  $g(t)$  funksiya aniqlangan bo'lib, uning uchun  $G(t)$  funksiya boshlang'ich funksiya bo'lsin, ya'ni

$$\int g(t) dt = G(t) + C. \quad (2.1)$$

U holda  $x$  to'plamning hamma nuqtalarida  $G[g(x)]$  funksiya  $g[\varphi(x)]\varphi'(x)$  funksiya uchun boshlang'ich funksiya bo'ladi, ya'ni

$$\int g[\varphi(x)]\varphi'(x) dx = G[\varphi(x)] + C \quad (2.2)$$

Ushbu

$$\int f(x) dx \quad (2.3)$$

integralni hisoblash talab qilingan bo'lsin. Ko'p hollarda, yangi o'zgaruvchi sifatida shunday differensiallanuvchi  $t = \varphi(x)$  funksiyani tanlash mumkin bo'ladi, bunda

$$f(x) dx = g[(\varphi(x))]\varphi'(x) dx \quad (2.4)$$

tenglik o'rinni bo'lib,  $g(t)$  funksiya,  $f(x)$  funksiyaga nisbatan oson integrallanadi, ya'ni

$$\int g(t) dt = G(t) + C$$

bundan  $t = \varphi(x)$  almashtirish natijasida hisoblash talab qilingan integralni hosil qilamiz:

$$\int f(x) dx = G[\varphi(x)] + C \quad (2.5)$$

(2.3) integralni hisoblashning bu usuli, o'zgaruvchilarni *almashtirish usuli* deyiladi.

Albatta, integrallashning bu usuli hamma integrallarni hisoblash uchun ham qo'llanilavermaydi. Integrallarni hisoblaganda, o'zgaruvchilarni almashtirish usulini qo'llashda, almashtirishni to'g'ri tanlash hisoblovchining mahoratiga bog'liq.

Misol uchun,  $\int \frac{\varphi'(x)}{\varphi(x)} dx$  ko'rinishdagi integrallarni hisoblashda,

albatta,  $t = \varphi(x)$  almashtirish, olish kerak:

$$\int \frac{\varphi'(x)}{\varphi(x)} dx = \int \frac{d\varphi(x)}{\varphi(x)} = \int \frac{dt}{t} = (\ln|t| + C) \Big|_{t=\varphi(x)} = \ln|\varphi(x)| + C \quad (2.6)$$

Shu tipdag'i integrallar turiga  $\int ctgx dx$  ham kiradi:

$$\int ctgx dx = \int \frac{(\sin x)'}{\sin x} dx = \ln|\sin x| + C.$$

Ba'zi hollarda, integralni hisoblashda, o'zgaruvchilarni almashtirish usulini qo'llash uchun, avvalo, integral ostida funksiyaning shaklini o'zgartirish maqsadga muvofiq bo'ladi. Masalan,  $\int \frac{1}{\sin x} dx$

integralni hisoblashda,  $\sin x = 2 \sin \frac{x}{2} \cos \frac{x}{2}$  tenglikni e'tiborga olib, integral ostidagi ifodaning shaklini o'zgartirib, (2.6) formulani e'tiborga olsak, natijada

$$\begin{aligned} \int \frac{1}{\sin x} dx &= \int \frac{1}{2 \sin \frac{x}{2} \cos \frac{x}{2}} dx = \\ &= \int \frac{1}{2 \operatorname{tg} \frac{x}{2} \cdot \cos^2 \frac{x}{2}} dx = \int \frac{\left( \operatorname{tg} \frac{x}{2} \right)'}{\operatorname{tg} \frac{x}{2}} dx = (\ln|\operatorname{tg} \frac{x}{2}| + C) \Big|_{\operatorname{tg} \frac{x}{2}} = \ln \left| \operatorname{tg} \frac{x}{2} \right| + C. \end{aligned} \quad (2.7)$$

bo'lishini topamiz.

**2.1 – misol.** Quyidagi integrallarni hisoblang:

$$1) \int \frac{x^2 dx}{3-x^6}; \quad 2) \int \frac{\cos x dx}{\sqrt{1+3 \sin x}}; \quad 3) \int \operatorname{tg}^3 \varphi d\varphi; \quad 3) \int \frac{\sqrt{2+\ln x}}{x}, x > 0;$$

$$5) \int x \sqrt{a-x} dx; \quad 6) \int \frac{dt}{t^2 \sqrt{a+t^2}}; \quad 7) \int \frac{x^2+1}{\sqrt{x^6-7x^4+x^2}} dx.$$

**Yechilishi.** 1)  $\int \frac{x^2 dx}{3-x^6}$  integralni hisoblashda  $t = x^3$  almashtirishni olish qulay. Bu almashtirishni bajarib, integrallar jadvalining 15 – formulasiga asosan, quyidagiga ega bo'lamiz:

$$dt = 3x^2 dx, \quad x^2 dx = \frac{1}{3} dt,$$

$$\int \frac{x^2 dx}{3-x^6} = \frac{1}{3} \int \frac{dt}{3-t^2} = -\frac{1}{3} \int \frac{dt}{t^2 - (\sqrt{3})^2} = \left( -\frac{1}{6\sqrt{3}} \ln \left| \frac{t-\sqrt{3}}{t+\sqrt{3}} \right| + C \right) \Big|_{t=x^3} = -\frac{1}{6\sqrt{3}} \ln \left| \frac{x^3-\sqrt{3}}{x^3+\sqrt{3}} \right| + C.$$

**Misolni Maple tizimidan foydalanib, yechish:**

> f:=(x^2)/(3-x^6);

$$f := \frac{x^2}{3-x^6}$$

> Int(f,x);

$$\int \frac{x^2}{3-x^6} dx$$

> int(f,x);

$$\frac{1}{9}\sqrt{3} \operatorname{arctanh}\left(\frac{x^3\sqrt{3}}{3}\right)$$

> Int(f,x)=int(f,x);

$$\int \frac{x^2}{3-x^6} dx = \frac{1}{9}\sqrt{3} \operatorname{arctanh}\left(\frac{x^3\sqrt{3}}{3}\right)$$

2)  $\int \frac{\cos x dx}{\sqrt{1+3\sin x}}$  integralni hisoblashda  $t=1+3\sin x$  almashtirishni olish maqsadga muvofiq bo'ladi. Bundan

$$dt = 3\cos x dx, \quad \cos x dx = \frac{1}{3} dt,$$

$$\int \frac{\cos x dx}{\sqrt{1+3\sin x}} = \frac{1}{3} \int \frac{dt}{\sqrt{t}} = \frac{1}{3} \int t^{-\frac{1}{2}} dt = \frac{1}{3} \left[ 2t^{\frac{1}{2}} + C \right] \Big|_{t=1+3\sin x} = \frac{2}{3} \sqrt{1+3\sin x} + C.$$

*Misolni Maple tizimidan foydalanib yechish:*

> f:=cos(x)/sqrt(1+3\*sin(x));

$$f := \frac{\cos(x)}{\sqrt{1+3\sin(x)}}$$

> Int(f,x);

$$\int \frac{\cos(x)}{\sqrt{1+3\sin(x)}} dx$$

> int(f,x);

$$\frac{2}{3} \sqrt{1+3\sin(x)}$$

> Int(f,x)=int(f,x);

$$\int \frac{\cos(x)}{\sqrt{1+3\sin(x)}} dx = \frac{2}{3} \sqrt{1+3\sin(x)}$$

3)  $\int \operatorname{tg}^3 \varphi d\varphi$  integralni hisoblash uchun  $\varphi = \operatorname{arcgt}, \quad t = \operatorname{tg} \varphi$  almashtirish olamiz va

$$\begin{aligned} d\varphi &= \frac{1}{1+t^2} dt, \quad \int \operatorname{tg}^3 \varphi d\varphi = \int \frac{t^3}{1+t^2} dt = \int \left(t - \frac{t}{1+t^2}\right) dt = \frac{t^2}{2} - \frac{1}{2} \int \frac{d(1+t^2)}{1+t^2} = \\ &= \left(\frac{t^2}{2} - \frac{1}{2} \ln|1+t^2| + C\right) \Big|_{t=\operatorname{tg}\varphi} = \frac{\operatorname{tg}^2 \varphi}{2} - \frac{1}{2} \ln|\operatorname{tg}^2 \varphi| + C = \frac{\operatorname{tg}^2 \varphi}{2} + \ln|\cos \varphi| + C. \end{aligned}$$

bo'ladi.

384566

4)  $\int \frac{\sqrt{1+\ln x}}{x} dx$  integralni hisoblashda  $t = 1 + \ln x$  almashtirish olamiz.

Natijada

$$dt = \frac{dx}{x}, \quad \int \frac{\sqrt{1+\ln x}}{x} dx = \int \sqrt{t} dt = \int t^{\frac{1}{2}} dt = \left( \frac{2}{3} t^{\frac{3}{2}} + C \right) \Big|_{t=1+\ln x} = \frac{2}{3} \sqrt{(1+\ln x)^3} + C.$$

bo‘ladi.

*Misolni Maple tizimidan foydalanib yechish:*

> f:=sqrt(2+ln(x))/x;

>

$$f := \frac{\sqrt{2 + \ln(x)}}{x}$$

> Int(f,x);

$$\int \frac{\sqrt{2 + \ln(x)}}{x} dx$$

> int(f,x);

$$\frac{2}{3} (2 + \ln(x))^{(3/2)}$$

> Int(f,x)=int(f,x);

>

$$\int \frac{\sqrt{2 + \ln(x)}}{x} dx = \frac{2}{3} (2 + \ln(x))^{(3/2)}$$

5)  $\int x \sqrt{a-x} dx$  - integralni hisoblashda  $t = \sqrt{a-x}$  almashtirishni olish

qulay bo‘ladi. Bundan,  $t^2 = a - x$ ,  $dt = -\frac{1}{2\sqrt{a-x}} dx$ ,  $x = a - t^2$ ,  $dx = -2t dt$ ,

$$\int x \sqrt{a-x} dx = -2 \int (a - t^2) t^2 dt = -2 \int (at^2 - t^4) dt =$$

$$= \left( -2a \frac{t^3}{3} + 2 \frac{t^5}{5} + C \right) \Big|_{t=\sqrt{a-x}} = \frac{2}{15} (3x^2 - ax - 2a^2) + C$$

*Misolni Maple tizimidan foydalanib yechish:*

> Int(x\*sqrt(a-x),x)=int(x\*sqrt(a-x),x);

$$\int x \sqrt{a-x} dx = -\frac{2 (2 a + 3 x) (a - x)^{(3/2)}}{15}$$

6)  $\int \frac{dt}{t^2 \sqrt{a+t^2}}$  integralda  $x = \frac{1}{t}$  almashtirish olib, uni quyidagicha

hisoblaymiz:

$$\int \frac{dt}{t^2 \sqrt{a+t^2}} = - \int \frac{x dx}{\sqrt{ax^2 + 1}} = -\frac{1}{2a} \int \frac{d(ax^2 + 1)}{\sqrt{ax^2 + 1}} = -\frac{\sqrt{ax^2 + 1}}{a} = -\frac{\sqrt{a+t^2}}{at} + C$$

*Misolni Maple tizimidan foydalanib yechish:*

$$> \text{Int}(1/(t^2 * \sqrt{a+t^2}), t) = \int \frac{1}{t^2 \sqrt{a+t^2}} dt = -\frac{\sqrt{a+t^2}}{ta}$$

7)  $\int \frac{x^2 + 1}{\sqrt{x^6 - 7x^4 + x^2}} dx$  integralda avvalo, integral ostidagi ifodaning shaklini o'zgartiramiz:

$$\begin{aligned} \int \frac{x^2 + 1}{\sqrt{x^6 - 7x^4 + x^2}} dx &= \int \frac{1 + \frac{1}{x^2}}{\sqrt{x^2 - 7 + \frac{1}{x^2}}} dx = \\ &= \int \frac{d\left(\frac{x-1}{x}\right)}{\sqrt{\left(\frac{x-1}{x}\right)^2 - 5}} dx = \int \frac{dt}{\sqrt{t^2 - 5}}, \end{aligned}$$

bunda,  $t = x - \frac{1}{x}$ . Endi integrallar jadvalining 17-formulasiga asosan, integralni hisoblaymiz. Natijada,

$$\int \frac{x^2 + 1}{\sqrt{x^6 - 7x^4 + x^2}} dx = \left( \ln \left| t + \sqrt{t^2 - 5} \right| + C \right) \Big|_{t=x-\frac{1}{x}} = \ln \left| x - \frac{1}{x} + \sqrt{x^2 - 7 + \frac{1}{x^2}} \right| + C.$$

bo'ladi.

*Misolni Maple tizimidan foydalanib yechish:*

$$> \text{Int}((x^2+1)/\sqrt{x^6-7x^4+x^2}, x) = \int \frac{(x^2+1)/\sqrt{x^6-7x^4+x^2}}{x} dx;$$

$$\begin{aligned} \int \frac{x^2 + 1}{\sqrt{x^6 - 7x^4 + x^2}} dx &= \\ \frac{1}{2} x \sqrt{x^4 - 7x^2 + 1} \left( \ln \left( -\frac{7}{2} + x^2 + \sqrt{x^4 - 7x^2 + 1} \right) + \operatorname{arctanh} \left( \frac{-2 + 7x^2}{2\sqrt{x^4 - 7x^2 + 1}} \right) \right) & \end{aligned}$$

**2.2. Bo'laklab integrallash usuli.** Integrallarni hisoblashda bo'laklab integrallash usuli muhim usullardan biri hisoblanadi. Bu usul quyidagi tasdiqqa asoslangan:

$u(x)$  va  $v(x)$  funksiyalar biror  $x$  oraliqda aniqlangan va differensiallanuvchi bo'lsin. Agar shu oraliqda  $v(x)u'(x)$  funksiyaning boshlang'ich funksiyasi mavjud bo'lsa, u holda  $u(x)v'(x)$  funksiyaning ham boshlang'ich funksiyasi mavjud bo'ladi va

$$\int u(x)v'(x)dx = u(x)v(x) - \int v(x)u'(x)dx \quad (2.8)$$

yoki

$$\int u dv = uv - \int v du \quad (2.8')$$

formula o‘rinli. (2.8) yoki (2.8’) formula bo‘laklab integrallash formulasi deyiladi. (2.8) formula  $\int u(x)v'(x)dx$  integralni hisoblash masalasini,  $\int v(x)u'(x)dx$  integralni hisoblash masalasiga olib keladi. Ko‘p hollarda, oxirgi integral, oldingi integralga qaraganda osonroq hisoblanadi.

### 2.3 - misol. Ushbu

$$\int x^\alpha \ln x dx, \quad \alpha \in R$$

integralni hisoblang.

**Yechilishi.** 1) Avvalo, integralni  $\alpha \neq -1$  bo‘lganda xisoblaymiz.

$u = \ln x, \quad dv = x^\alpha dx$  deb belgilab,  $du = \frac{dx}{x}, \quad v = \frac{x^{\alpha+1}}{\alpha+1}$  formulalarga asosan,

$$J = \int x^\alpha \ln x dx = \frac{x^{\alpha+1}}{\alpha+1} \ln x - \frac{1}{\alpha+1} \int x^\alpha dx = \frac{x^{\alpha+1}}{\alpha+1} \ln x - \frac{x^{\alpha+1}}{(\alpha+1)^2} + C = \frac{x^{\alpha+1}}{\alpha+1} \left( \ln x - \frac{1}{\alpha+1} \right) + C$$

ekanligini topamiz.

2)  $\alpha = -1$  bo‘lsin. Bu holda

$$\int x^{-1} \ln x dx = \int \frac{\ln x}{x} dx = \int \ln x d(\ln x) = \frac{1}{2} \ln^2 x + C.$$

### 2. 4 - misol. Ushbu

$$\int x^2 3^x dx$$

integralni hisoblang.

**Yechilishi.**  $u = x^2, dv = 3^x dx$  deb belgilab, (2.8) formulaga asosan, topamiz:

$$du = 2x dx, \quad v = \frac{3^x}{\ln 3}, \quad (2.9)$$

$$\int x^2 \cdot 3^x dx = \frac{x^2 \cdot 3^x}{\ln 3} - \frac{2}{\ln 3} \int x \cdot 3^x dx.$$

Oxirgi integralga yana (2.8) formulani qo‘llaymiz:  $u = x, dv = 3^x dx$  deb belgilab, (2.8) formulaga asosan,

$$du = dx, \quad v = \frac{3^x}{\ln 3}$$

$$\int x \cdot 3^x dx = \frac{x \cdot 3^x}{\ln 3} - \frac{1}{\ln 3} \int 3^x dx = \frac{x \cdot 3^x}{\ln 3} - \frac{3^x}{(\ln 3)^2}.$$

ekanligini olamiz. Oxirgi natijani (2.9) ga keltirib qo‘ysak, natijada

$$\int x^2 \cdot 3^x = \frac{1}{\ln 3} \cdot x^2 3^x - \frac{2x 3^x}{(\ln 3)^2} + \frac{2 \cdot 3^x}{(\ln 3)^3} = \frac{3^x}{\ln 3} \left( x^2 - \frac{2x}{\ln 3} + \frac{2}{(\ln 3)^2} \right) + C.$$

bo‘lishini topamiz.

*Misolni Maple tizimidan foydalanim yechish:*

> restart:with(student):J:=Int(((x)^2)\*(3)^x,x);

$$J = \int x^2 3^x dx$$

> J=intparts(Int(((x)^2)\*(3)^x,x),x^2);

$$J = \frac{x^2 \cdot 3^x}{\ln 3} - \frac{2}{\ln 3} \int x \cdot 3^x dx$$

> intparts(%);

$$J = \frac{x^2 3^x}{\ln(3)} - \frac{2x 3^x}{(\ln 3)^2} + \int \frac{2 3^x}{(\ln 3)^2} dx$$

> value(%);

$$J = \frac{x^2 3^x}{\ln(3)} - \frac{2x 3^x}{\ln(3)^2} + \frac{2 3^x}{\ln(3)^3}$$

## 2.5 - misol. Ushbu

$$\int x^2 \arctan x dx$$

integralni hisoblang.

**Yechilishi.**  $u = \arctan x, dv = x^2 dx$  deb belgilaylik. U holda,

$du = \frac{1}{1+x^2} dx, v = \frac{x^3}{3},$  formulalarga asosan, integralning qiyamati

$$\begin{aligned} \int x^2 \arctan x dx &= \frac{1}{3} x^3 \arctan x - \frac{1}{3} \int \frac{x^3}{1+x^2} dx = \\ &= \frac{1}{3} x^3 \arctan x - \frac{1}{3} \int \left( x - \frac{x}{1+x^2} \right) dx = \frac{1}{3} x^3 \arctan x - \frac{x^2}{6} + \frac{1}{6} \int \frac{d(1+x^2)}{1+x^2} = \\ &= \frac{1}{3} x^3 \arctan x - \frac{x^2}{6} + \frac{1}{6} \ln(1+x^2) + C \end{aligned}$$

bo‘ladi.

## 2.6-misol. Ushbu

$$\int x^2 \sin x dx$$

integralni hisoblang.

**Yechilishi.** Berilgan integralni hisoblash uchun  $u = x^2, dv = \sin x dx$  deb olib, (2.8) formulaga asosan,  $du = 2x dx, v = -\cos x,$  bo‘lishini topamiz.

Unda

$$\int x^2 \sin x dx = -x^2 \cos x + 2 \int x \cos x dx. \quad (2.10)$$

bo‘ladi. Oxirgi munosabatning o‘ng tomonidagi integralni hisoblash uchun unga yana bir marta (2.8) formulani qo‘llaymiz:

$$u = x, dv = \cos x dx, du = dx, v = \sin x$$

Bundan

$$\int x \cdot \cos x dx = x \cdot \sin x - \int \sin x dx = x \cdot \sin x + \cos x.$$

ekanligini topamiz. Olingan natijani (2.10) ga keltirib qo‘yamiz.

Natijada,  $\int x^2 \sin x dx = -x^2 \cos x + 2x \sin x + 2 \cos x = (2 - x^2) \cos x + 2x \sin x + C$ .

**2.7-misol.**  $I = \int \sqrt{x^2 + a^2} dx$  integralni hisoblang.

**Yechilishi.**  $u = \sqrt{x^2 + a^2}$   $dv = dx$  deb belgilab, (2.8) formuladan foydalanib, berilgan integralni quyidagi holga keltiramiz:

$$\int \sqrt{x^2 + a^2} dx = x \cdot \sqrt{x^2 + a^2} - \int \frac{x^2 dx}{\sqrt{x^2 + a^2}} \quad (2.11)$$

(2.11) ning o‘ng tomonidagi integralni hisoblashda, integrallar jadvalining 17 - formulasidan foydalanamiz:

$$\int \frac{x^2 + a^2 - a^2}{\sqrt{x^2 + a^2}} dx = I - a^2 \int \frac{dx}{\sqrt{x^2 + a^2}} = I - a^2 \ln|x + \sqrt{x^2 + a^2}| \quad (2.12)$$

(2.12) ni (2.11) ga olib borib qo‘yish natijasida,

$$\int \sqrt{x^2 + a^2} dx = \frac{x\sqrt{x^2 + a^2}}{2} + \frac{a^2}{2} \ln|x + \sqrt{x^2 + a^2}| + C \quad (2.13)$$

ekanligini topamiz. 2-bandda yechilgan misollarni tahlil qilish natijasida, bo‘laklab integrallash usuli bilan hisoblanadigan integralarning ko‘proq qismini, shartli ravishda, quyidagi uch guruhga ajratish mumkin.

1. Birinchi guruhga integral ostidagi funksiya tarkibida ko‘paytuvchi sifatida

$$\ln x, \arcsin x, \arccos x, \operatorname{arctgx}, (\arcsin x)^2, \\ (\arccos x)^2, (\operatorname{arctgx})^2, \ln \phi(x), \dots$$

funksiyalardan biri qatnashgan integrallar kiradi (2.3, 2.5-misollarga qarang).

**1-eslatma.** Integral ostidagi funksiya tarkibida ko‘paytuvchi sifatida  $(\operatorname{arctgx})^2, (\arccos x)^2, \dots$  funksiyalar qatnashsa, integralni hisoblashda (2.8) formula ikki marta qo‘llaniladi.

2. Ikkinci guruhga  $\int p(x) \cos(kx) dx, \int p(x) \sin(kx) dx, \int p(x) x^n dx$  ko‘rinishdagi integrallar kiradi, bunda  $p(x) - o‘zgarmas koeffisientli n -$  darajali ko‘phad,  $k - o‘zgarmas$  son.

**2-eslatma.** Ikkinci guruhdagagi integrallarni hisoblashda  $p(x)$  ko‘phadning darajasi qancha bo‘lsa, shuncha marta (2.8) formula qo‘llaniladi, bunda  $u(x)$  sifatida  $p(x)$  ni olish maqsadga muvofiq bo‘ladi. (2.8) formula har bir qo‘llanganda,  $p(x)$  ko‘phadning darajasi bittaga kamayadi. (2.4, 2.7-misollarga qarang).

3. Uchinchi guruhga, quyidagi

$$\int e^u \sin bx dx, \int e^u \cos bx dx, \int \sin(\ln x) dx, \int \cos(\ln x) dx, \dots$$

integrallar kiradi (2.6-misolga qarang).

Endi, yuqorida keltirilgan uchta guruhning birortasiga ham kirmaydigan, lekin (2.8) bo'laklab integrallash formulasi yordamida hisoblanadigan integrallarning ba'zilarini qaraymiz.

### 2.8 - misol. Quyidagi

$$J = \int e^{ax} \sin bx dx, J_1 = \int e^{ax} \cos bx dx \quad (a, b = \text{const})$$

integralarni hisoblang.

**Yechilishi.**  $u = e^{ax}$ ,  $dv = \sin bx dx$  deb belgilab, (2.8) formulaga asosan,

$$\begin{aligned} du &= ae^{ax} dx, v = -\frac{\cos bx}{b} \\ J &= -\frac{e^{ax} \cdot \cos bx}{b} + \frac{a}{b} \int e^{ax} \cos bx dx \end{aligned} \quad (2.14)$$

bo'lishini olamiz. Oxirgi (2.14) munosabatning o'ng tomonidagi integralni hisoblash uchun, unga yana bir marta (2.8) formulani qo'llaymiz: Bunda  $u = e^{ax}$ ,  $dv = \cos bx dx$  deb belgilaymiz. U holda,

$$du = ae^{ax} dx, v = \frac{\sin bx}{b}$$

va

$$\int e^{ax} \cos bx dx = \frac{e^{ax} \sin bx}{b} - \frac{a}{b} \int e^{ax} \sin bx dx = \frac{1}{b} \cdot e^{ax} \sin bx - \frac{a}{b} I. \quad (2.15)$$

(2.15) ni (2.14) ga olib borib qo'ysak, natijada,

$$I = -\frac{e^{ax} \cdot \cos bx}{b} + \frac{a}{b^2} e^{ax} \sin bx - \frac{a^2}{b^2} I,$$

/ ga nisbatan birinchi tartibli chiziqli tenglamani hosil qilamiz. Bu tenglamadan,

$$I = \frac{a \sin bx - b \cos bx}{b^2 + a^2} e^{ax}$$

ekanligi kelib chiqadi.

Shunday qilib,

$$\int e^{ax} \sin bx dx = \frac{a \sin bx - b \cos bx}{b^2 + a^2} \cdot e^{ax} + C. \quad (2.16)$$

Xuddi shunday usul bilan,

$$I_1 = \int e^{ax} \cos bx dx = \frac{b \sin bx + a \cos bx}{a^2 + b^2} e^{ax} + C \quad (2.17)$$

ekanligiga ishonch hosil qilish mumkin.

### 2.9-misol. Ushbu

$$\int \frac{x}{\sin^2 x} dx$$

integralni hisoblang.

**Yechilishi.** Bu integral yuqoridagi uch guruh integrallarning birortasiga ham kirmaydi, lekin u, (2.8) bo'laklab integrallash formulasi yordamida, osongina hisoblanadi. Bunda  $u = x$ ,  $dv = \frac{dx}{\sin^2 x}$  deb belgilab,

$$\begin{aligned} \int \frac{x dx}{\sin^2 x} &= -x \operatorname{ctgx} + \int \operatorname{ctgx} dx = -x \operatorname{ctgx} + \int \frac{\cos x}{\sin x} dx = \\ &= -x \operatorname{ctgx} + \int \frac{du}{u} = -x \operatorname{ctgx} + \ln|u|_{u=\sin x} + C = -x \operatorname{ctgx} + \ln|\sin x| + C \end{aligned}$$

bo'lishini topamiz.

### 2.10-misol. Ushbu

$$I_n = \int \frac{dx}{(x^2 + a^2)^n} \quad (a = \text{const}, \quad n = 1, 2, \dots)$$

integralni hisoblang.

**Yechilishi.** Bu integral ham yuqorida keltirilgan uch guruh integrallarning birortasiga ham kirmaydi. Bu ko'rinishdagi integrallarni hisoblash uchun *rekurrent* formula keltirib chiqaramiz: buning uchun  $u = \frac{1}{(x^2 + a^2)^n}$ ,  $dv = dx$  deb belgilasak,

$$du = -2nx(x^2 + a^2)^{-n-1} dx, \quad v = x.$$

bo'ladi.

U holda, (2.8) bo'laklab integrallash formulasiga asosan,

$$\begin{aligned} I_n &= \int \frac{dx}{(x^2 + a^2)^n} = \frac{x}{(x^2 + a^2)^n} + 2n \int \frac{x^2 dx}{(x^2 + a^2)^{n+1}} = \\ &= \frac{x}{(x^2 + a^2)^n} + 2n I_{n+1} - 2na^2 I_{n+1}. \end{aligned}$$

bo'ladi. Bundan  $I_{n+1}$  ni topamiz:

$$I_{n+1} = \frac{x}{2na^2(x^2 + a^2)^n} + \frac{2n-1}{2na^2} I_n. \quad (2.18)$$

Bu rekurrent formula,  $I_{n+1}$  integralni hisoblashni  $I_n$  integralni hisoblashga, ya'ni indeksi bitta kam bo'lgan integralni hisoblashga keltiradi. (2.18) rekurrent formula,  $I_1$  integral hisoblanganda,  $I_1$  integralni hisoblashda hech qanday qiyinchilik tug'dirmaydi. O'z navbatida,  $I_1$  berilganda, (2.18) formulada  $n = 2$  deb,  $I_1$  integral topiladi, va hokazo  $n$  ning qolgan boshqa istalgan qiyamatiga to'g'ri kelgan integralni hisoblash hech qanday qiyinchilik tug'dirmaydi.  $I_1$  integral esa, integrallar jadylalning 14-formulasiga asosan, hisoblanadi.

### 2.11 -misol. Ushbu

$$I = \int \sqrt{a^2 - x^2} dx, \quad a \neq 0.$$

integral hisoblansin.

**Yechilishi.** Berilgan integral yuqoridagi uch guruh integrallarning birortasiga ham kirmaydi, lekin u bo'laklab integrallash usuli bilan hisoblanadi. Haqiqatan ham,  $u = \sqrt{a^2 - x^2}$ ,  $dv = dx$  deb olinsa, u holda

$$du = -\frac{x dx}{\sqrt{a^2 - x^2}}, \quad v = x, \text{ bo'ladi va (2.8) formulaga asosan,}$$

$$I = \int \sqrt{a^2 - x^2} dx = x \sqrt{a^2 - x^2} + \int \frac{x^2 dx}{\sqrt{a^2 - x^2}}.$$

Oxirgi munosabatning o'ng tomonidagi integralni hisoblash uchun, integral ostidagi funksiyani quyidagicha shakl almashtiramiz:

$$\frac{x^2}{\sqrt{a^2 - x^2}} = \frac{x^2 + a^2 - a^2}{\sqrt{a^2 - x^2}} = \frac{a^2}{\sqrt{a^2 - x^2}} - \sqrt{a^2 - x^2},$$

va hisoblaymiz:

$$\int \frac{x^2}{\sqrt{a^2 - x^2}} dx = \int \frac{a^2}{\sqrt{a^2 - x^2}} dx - \int \sqrt{a^2 - x^2} dx = \frac{a^2}{2} \arcsin \frac{x}{|a|} - I.$$

Shunday qilib, berilgan integralni hisoblash uchun,

$$I = x(a^2 - x^2) + \frac{a^2}{2} \arcsin \frac{x}{|a|} - I$$

munosabatni hosil qilamiz. Bundan,

$$I = \frac{x \sqrt{a^2 - x^2}}{2} + \frac{a^2}{4} \arcsin \frac{x}{|a|} + C. \quad (2.19)$$

## 2.12-misol. Ushbu

$$1) I_n = \int \frac{dx}{\sin^n x}, n > 2; \quad 2) I_n = \int \sin^n x dx, n > 2$$

ko'rinishdagи integrallarni hisoblash uchun rekurrent formulalar keltirib chiqaring.

**Yechilishi.** 1)  $\int \frac{dx}{\sin^n x}$  integralni bo'laklab integrallash usuli yordamida hisoblaymiz:

$$\begin{aligned} I_n &= \int \frac{dx}{\sin^n x} = \int \frac{dx}{\sin^{n-2} x \cdot \sin^2 x} = \left[ u = \frac{1}{\sin^{n-2} x}, \quad dv = \frac{dx}{\sin^2 x}, \right. \\ du &= (2-n) \sin^{1-n} x \cdot \cos x dx, \quad v = -\operatorname{cosec} x = -\frac{\cos x}{\sin^{n-1} x} + \\ &+ (2-n) \int \frac{\cos^2 x}{\sin^n x} dx = -\frac{\cos x}{\sin^{n-1} x} + (2-n) \int \frac{dx}{\sin^n x} - \\ &- (2-n) \int \frac{dx}{\sin^{n-2} x} = -\frac{\cos x}{\sin^{n-1} x} + (2-n) I_n - (2-n) I_{n-2}. \end{aligned}$$

Bundan,

$$I_n = -\frac{\cos x}{(n-1) \sin^{n-1} x} + \frac{n-2}{n-1} I_{n-2}. \quad (2.20)$$

(2.20) rekurrent formulani qo'llashda, avvalo,  $n=3$  deb,  $I_1 = \int \frac{dx}{\sin x}$  integrallar hisoblanadi.  $\int \frac{dx}{\sin x}$  integralni hisoblash yuqorida ko'rsatildi (2.7 formulaga qarang).

2)  $I_n = \int \sin^n x dx$  integralni hisoblashning rekurrent formulasini chiqarish uchun, uni quyidagicha bo'laklab integrallaymiz:

$$\begin{aligned} I_n &= \int \sin^n x dx = - \int \sin^{n-1} x d \cos x = [u = \sin^{n-1} x, dv = d \cos x, \\ du &= (n-1) \sin^{n-2} x \cdot \cos x dx, v = \cos x] = - \cos x \cdot \sin^{n-1} x + \\ &+ (n-1) \int \sin^{n-2} x \cos^2 x dx = - \cos x \cdot \sin^{n-1} x + (n-1) \int \sin^{n-2} x (1 - \sin^2 x) dx = - \\ &= - \cos x \cdot \sin^{n-1} x + (n-1) I_{n-2} - (n-1) I_n. \end{aligned}$$

Bundan

$$I_n = - \frac{\cos x \sin^{n-1} x}{n} + \frac{n-1}{n} I_{n-2}$$

ko'rinishdagi rekurrent formulani topamiz.

### Mustaqil yechish uchun misollar

Quyidagi integrallarni hisoblang:

$$2.1. \int x \sqrt{x^2 - 7} dx.$$

$$2.2. \int \frac{x^2}{\sqrt[3]{3-x^3}} dx.$$

$$2.3. \int \frac{e^{3x} dx}{(e^{3x} - 4)^3}.$$

$$2.4. \int \frac{xdx}{x^2 + 8}.$$

$$2.5. \int \frac{2x+1}{x^2+x-5} dx.$$

$$2.6. \int \frac{2x-3}{8+3x-x^2} dx.$$

$$2.7. \int \frac{6x-5}{\sqrt{3x^2-5x+4}} dx.$$

$$2.8. \int \frac{x-1}{\sqrt{2x-x^2}} dx.$$

$$2.9. \int \frac{10x-3x^2}{x^3-5x^3} dx.$$

Quyidagi integrallarni hisoblang:

$$2.10. \int \frac{e^x dx}{2e^x + 7}.$$

$$2.11. \int \frac{e^x dx}{x^2}.$$

$$2.12. \int \frac{1}{x \ln x} dx.$$

$$2.13. \int \frac{\sqrt[2]{\ln^5 x}}{x} dx.$$

$$2.14. \int x^2 e^{1-x^2} dx.$$

### 3-§. Rasional funksiyalarni integrallash

**3.1. Noma'lum koeffisientlar usuli.** Ikkita algebraic ko'phadning nisbatiga, ya'ni

$$f(x) = \frac{P_m(x)}{Q_n(x)} \quad (3.1)$$

ifodali *rasional funksiya* yoki *rasional kasr* deyiladi. Bunda,  $P_m(x) = b_0 + b_1x + \dots + b_mx^m$  va  $Q_n(x) = a_0 + a_1 + \dots + a_nx^n$  ( $b_m, a_n \neq 0, m \geq 0, n \geq 1$ ) haqiqiy koeffisientli ko'phadlar, deb faraz qilinadi.

Agar  $m < n$  bo'lsa, u holda  $\frac{P_m(x)}{Q_n(x)}$  to'g'ri kasr rasional funksiya,

$m \geq n$  bo'lganda esa, noto'g'ri kasr rasional funksiya deyiladi. Agar (3.1) rasional kasr, noto'g'ri kasr bo'lsa, u, kasrning suratini maxrajiga bo'lish yo'li bilan,

$$f(x) = w(x) + \frac{P_k(x)}{Q_n(x)} \quad (k < n) \quad (3.2)$$

ko'rinishga keltiriladi, bunda  $w(x)$  – biror ko'phad.

Oliy algebra kursidan ma'lumki, har qanday  $Q_n(x)$  ko'phadni, ushbu

$$Q_n(x) = a_n(x - \alpha)(x - \beta)\dots(x - \nu) \quad (3.3)$$

(bunda  $a_n = Q_n(x)$  ko'phadda  $x$  ning yuqori darajasi oldidagi koeffisient,  $\alpha, \beta, \dots, \nu$  lar –  $Q_n(x) = 0$  tenglamaning ildizlari) ko'rinishda tasvirlash mumkin.

Agar ko'phadning ildizlari ichida o'zaro tenglari bo'lsa, u holda, ko'phad,

$$Q_n(x) = a_n(x - \alpha)^r(x - \beta)^s\dots(x - \nu)^t \quad (3.4)$$

ko'rinishga keltiriladi, bunda  $r, s, \dots, t$  – butun sonlar,  $\alpha, \beta, \dots, \nu$  sonlar esa, mos ravishda,  $Q_n(x)$  ko'phadning  $r, s, \dots, t$  karrali ildizlari deyiladi va  $r + s + \dots + t = n$  bo'ladi.

Ko'phadning (3.3) dagi ildizlari ichida kompleks ildizlar ham bo'lishi mumkin. Algebra kursidan ma'lumki, agar  $\alpha = a + ib$  haqiqiy koeffisientli ko'phadning  $r$  – karrali ildizi bo'lsa, u holda unga qo'shma  $\bar{\alpha} = a - ib$  son ham ko'phadning  $r$  – karrali ildizi bo'ladi. Boshqacha

aytganda, agar (3.4) ning tarkibida  $(x - \alpha)^r$  ( $\alpha = a + bi$ ) bo'lsa, u holda, (4) ning tarkibidagi  $(x - \alpha)^r$  va  $(x - \bar{\alpha})^r$  larning ko'paytmasi, quyidagicha bo'ladi:

$$\begin{aligned} (x - \alpha)^r (x - \bar{\alpha})^r &= \left[ x - (a + bi) \right] \cdot \left[ x - (a - bi) \right]^r = \\ &= \left[ x^2 - x(a + bi) - x(a - bi) + a^2 + b^2 \right]^r = \left[ x^2 - 2ax + a^2 + b^2 \right]^r = \\ &= (x^2 + 2px + q)^r, \end{aligned}$$

bunda  $p = -a$ ,  $q = a^2 + b^2$ ,  $p^2 - q < 0$ ,  $p$  va  $q$  – haqiqiy sonlar.

Xuddi shunday yuqoridagi mulohazalarni boshqa kompleks ildizlar uchun ham yuritsak, u holda, (3.4) quyidagi ko'rinishni oladi:

$$Q_n(x) = A_n(x - \alpha)^r \cdot (x - \beta)^s \cdots (x^2 + 2px + q)^k (x^2 + 2ux + v)^l, \dots, \quad (3.5)$$

bunda,  $\alpha, \beta, \dots, p, q, u, v$  – haqiqiy sonlar,  $r, s, \dots, t, k$  – natural sonlar.

Algebra kursida quyidagi teorema isbot qilinadi.

**3.1-teorema.** Agar  $\frac{P_m(x)}{Q_n(x)}$  to'g'ri rasional kasr tarkibidagi  $Q_n(x)$

ko'phad (3.5) shaklda tasvirlangan bo'lsa, u holda, rasional kasr, yagona ravishda,

$$\begin{aligned} \frac{P_m(x)}{Q_n(x)} &= \frac{A_1}{x - \alpha} + \frac{A_2}{(x - \alpha)^2} + \dots + \frac{A_r}{(x - \alpha)^r} + \dots + \\ &+ \dots + \frac{M_1 x + N_1}{x^2 + 2px + q} + \frac{M_2 x + N_2}{(x^2 + 2px + q)^2} + \dots + \frac{M_t x + N_t}{(x^2 + 2px + q)^t} + \dots \end{aligned} \quad (3.6)$$

(bunda,  $A_1, A_2, \dots, A_r, \dots, M_1, N_1, M_2, N_2, \dots, M_t, N_t, \dots$  – noma'lum haqiqiy sonlar) ko'rinishda tasvirlanadi. (3.6) tenglik,  $x$  ning  $Q_n(x)$  ko'phadning haqiqiy ildizlariga teng bo'limagan hamma qiymatlarida o'rini.

(3.6) dagi noma'lum koeffisientlarni topish uchun (3.6) ni umumiyl maxrajga keltirib (umumiyl maxraj  $Q_n(x)$ ) ikki ko'phadning tengligi haqidagi teoremagaga asosan, o'ng tomonidagi suratdagi hosil bo'lgan ko'phad bilan  $P_m(x)$  ko'phaddagi  $x$  ning bir xil darajalari oldidagi koeffisientlarni tenglashtirish natijasida, noma'lum koeffisientlarga nisbatan chiziqli algebraik tenglamalar sistemasi hosil bo'ladi. Bu sistemadan noma'lum koeffisientlarni topib, topilgan qiymatlarni (3.6) tenglikka keltirib qo'yamiz. Kasning yoyilmasidagi noma'lum koeffisientlarni topishning bu usuli, *noma'lum koeffisientlar usuli* deyiladi.

Shunday qilib,  $f(x) = \frac{P_m(x)}{Q_n(x)}$  rasional kasrning integralini hisoblash,  $w(x) = c_0 x^k + c_1 x^{k-1} + \dots + c_k$  shakldagi ko'phadni integrallashga va quyidagi

$$I. \frac{A}{x-\alpha}, \quad II. \frac{A}{(x-\alpha)^r}, \quad III. \frac{Mx+N}{x^2+px+q}, \quad IV. \frac{Mx+N}{(x^2+px+q)^k} \quad (3.7)$$

( $r > 1$ ) (bunda  $A, M, N, \alpha, p, q$  – haqiqiy sonlar,  $q - \frac{p^2}{4} > 0$ ) ko‘rinishdagi sodda kasrlarni integrallashga keltiriladi. Bu sodda kasrlarning integrallari quyidagicha hisoblanadi.

Quyidagi,  $\frac{A}{(x-a)^m} + \frac{Bx+C}{(x^2+px+q)^k}$  ( $A, B, C, a, p, q \in R$ ,  $k, m \in N$ )

ko‘rinishdagi sodda kasrlarni qaraymiz. U holda:

$$1) \ m=1 \text{ bo‘lganda, } \int \frac{A}{x-a} dx = A \int \frac{dx}{x-a} = A \ln|x-a| + C.$$

$$2) \ m > 1 \text{ bo‘lganda, } \int \frac{A}{(x-a)^m} dx = A \int (x-a)^{-m} dx = \frac{A}{1-m} \frac{1}{(x-a)^{m-1}} + C.$$

3)  $k=1$  bo‘lganda,  $a^2 = q - \frac{p^2}{4}$ ,  $x + \frac{p}{2} = t$  almashtirish olib, kvadrat uchhadni,  $x^2 + px + q = a^2 + t^2$  ko‘rinishga keltiramiz, va berilgan kasrning aniqmas integralini topamiz:

$$\begin{aligned} \int \frac{Bx+D}{x^2+px+q} dx &= B \int \frac{tdt}{a^2+t^2} + \frac{(2D-Bp)}{2} \int \frac{dt}{a^2+t^2} = \\ &= \frac{B}{2} \ln(x^2+px+q) + \frac{2D-Bp}{\sqrt{4q-p^2}} \operatorname{arctg} \frac{2x+p}{\sqrt{4q-p^2}} + C \end{aligned}$$

4)  $k > 1$  bo‘lganda,  $a^2 = q - \frac{p^2}{4}$ ,  $x + \frac{p}{2} = t$  almashtirish olib, kvadrat uchhadni  $x^2 + px + q = a^2 + t^2$  ko‘rinishga keltiramiz va berilgan kasrning aniqmas integralini topamiz:

$$\int \frac{Bx+D}{(x^2+px+q)^k} dx = \frac{B}{2} \frac{1}{1-k} \frac{1}{(a^2+t^2)^{k-1}} - \frac{(2D-Bp)}{2} \int \frac{dt}{(a^2+t^2)^k}.$$

Oxirgi ifodadagi integral esa, quyidagi

$$\int \frac{dt}{(a^2+t^2)^k} = \frac{1}{2(k-1)a^2} \left[ \frac{t}{(a^2+t^2)^{k-1}} - (2k-3) \int \frac{dt}{(a^2+t^2)^{k-1}} \right]$$

rekurrent formula orqali topiladi.

I va II tipdagisi kasrlarning integrallari,  $t = x - \alpha$  almashtirish yordamida hisoblanadi:

$$\int \frac{A}{x-\alpha} dx = A \int \frac{dt}{t} = A \ln|t|_{t=x-\alpha} + c = A \ln|x-\alpha| + c.$$

$$\int \frac{A}{(x-\alpha)^r} dx = A \int \frac{dt}{t^r} = \left( \frac{A}{r-1} \cdot \frac{1}{t^{r-1}} + C \right)_{t=x-\alpha} = -\frac{A}{(r-1)} \cdot \frac{1}{(x-\alpha)^{r-1}} + C.$$

III tipdagisi kasrning integralini hisoblash uchun, kvadrat uchhadni quyidagicha shakl almashtiramiz:

$$x^2 + px + q = \left( x + \frac{p}{2} \right)^2 + \left( q - \frac{p^2}{4} \right)$$

$a = \sqrt{q - \frac{p^2}{4}}$ ,  $t = x + \frac{p}{2}$  deb belgilab olib, integralni hisoblaymiz:

$$\begin{aligned} \int \frac{Mx + N}{x^2 + px + q} dx &= \int \frac{Mt + \left( N - \frac{Mp}{2} \right)}{t^2 + a^2} dt = \\ &= \frac{M}{2} \int \frac{2tdt}{t^2 + a^2} + \left( N - \frac{Mp}{2} \right) \int \frac{dt}{t^2 + a^2} = \\ &= \frac{M}{2} \int \frac{d(t^2 + a^2)}{t^2 + a^2} + \left( N - \frac{Mp}{2} \right) \frac{1}{a} \int \frac{d\left(\frac{t}{a}\right)}{\left(\frac{t}{a}\right)^2 + 1} = \\ &\left( \frac{M}{2} \right) \ln \left( t^2 + a^2 + \frac{2N - Mp}{2a} \operatorname{artng} \frac{t}{a} + c \right) = \\ &= \frac{M}{2} \ln \left( x^2 + px + q \right) + \frac{2N - Mp}{2a} \operatorname{arctg} \frac{x + \frac{p}{2}}{\sqrt{q - \frac{p^2}{4}}} + C. \end{aligned} \tag{3.8}$$

IV tipdagisi kasrning integralini hisoblashda yuqoridagi  $t = x + \frac{p}{2}$ ,  $a = \sqrt{q - \frac{p^2}{4}}$  belgilashlardan foydalanamiz:

$$\begin{aligned} \int \frac{Mx + N}{(x^2 + px + q)^r} dx &= \int \frac{Mt + \left( N - \frac{Mp}{2} \right)}{(t^2 + a^2)^r} dt = \\ &= \frac{M}{2} \int \frac{d(t^2 + a^2)}{(t^2 + a^2)^r} + \left( N - \frac{Mp}{2} \right) \int \frac{dt}{(t^2 + a^2)^r} = \frac{M}{2(r-1)} \cdot \frac{1}{(t^2 + a^2)^{r-1}} + \\ &+ \left( N - \frac{Mp}{2} \right) \int \frac{dt}{(t^2 + a^2)^r} = \frac{M}{2(r-1)} \cdot \frac{1}{(t^2 + a^2)^{r-1}} + \\ &+ \left( N - \frac{Mp}{2} \right) \int \frac{dt}{(t^2 - a^2)^r} = -\frac{M}{2(r-1)} \frac{1}{(x^2 + px + q)^{r-1}} + \left( N - \frac{Mp}{2} \right) \int \frac{dt}{(t^2 + a^2)^r} \end{aligned}$$

keyingi integral (2.18) rekurrent formula orqali hisoblanadi.

Shunday qilib, har qanday haqiqiy koeffisientli haqiqiy o'zgaruvchili rasional (rasional kasr) funksiyaning boshlang'ich funksiyasi – logarifm, arktangens va rasional funksiya orqali ifodalaran ekan.

### 3.1-misol. Ushbu

$$\int \frac{x^6 - 2x^4 + 3x^3 - 9x^2 + 4}{x^5 - 5x^3 + 4x} dx$$

integralni hisoblang.

**Yechilishi.** Integral ostidagi kasr – noto‘g‘ri kasr bo‘lganligi uchun, (3.2) ga asosan,  $P_6(x) = x^6 - 2x^4 + 3x^3 - 9x^2 + 4$  ko‘phadni  $Q_5(x) = x^5 - 5x^3 + 4x$  ko‘phadga bo‘lib,  $w(x) = x$  bo‘linma va  $P_4(x) = 3x^4 + 3x^3 - 13x^2 + 4$  qoldiqni topamiz, ya’ni

$$\frac{x^6 - 2x^4 + 3x^3 - 9x^2 + 4}{x^5 - 5x^3 + 4x} = x + \frac{3x^4 + 3x^3 - 13x^2 + 4}{x^5 - 5x^3 + 4x}.$$

Ravshanki,  $Q_5(x) = x^5 - 5x^3 + 4x$  ko‘phad  $x=1$  haqiqiy ildizga ega,  $Q_5(x) = x^5 - 5x^3 + 4x$  ko‘phadni  $x=1$  ga bo‘lib,

$$Q_5(x) = x(x-1)(x+1)(x-2)(x+2)$$

ko‘rinishga keltiramiz.

3.1-teoremaga asosan,  $\frac{P_4(x)}{Q_5(x)}$  kasr (3.6) ko‘rinishdagi sodda kasrlar yig‘indisi sifatida tasvirlanadi, ya’ni

$$\frac{3x^4 + 3x^3 - 13x^2 + 4}{x(x-1)(x+1)(x-2)(x+2)} = \frac{A}{x} + \frac{B}{x+1} + \frac{C}{x-1} + \frac{D}{x-2} + \frac{E}{x+2}. \quad (3.9)$$

Oxirgi tenglikni umumiy maxrajga keltirib, ushbu

$$\begin{aligned} 3x^4 + 3x^3 - 13x^2 + 4 &= A(x^2 - 1)(x^2 - 4) + Bx \cdot (x+1)(x^2 - 4) + \\ &+ C \cdot x(x-1)(x^2 - 4) + D \cdot x(x^2 - 1)(x+2) + E \cdot x(x^2 - 1)(x-2) \end{aligned}$$

tenglikni hosil qilamiz. Tenglikning o‘ng tomonidagi qavslarni ochib, ko‘phadlarning o‘zaro tengligi haqidagi xossaladan foydalanib,  $x$  ning bir xil darajalari oldidagi koeffisientlarni tenglashtiramiz:

$$\left. \begin{array}{l} x^4 \mid 3 = A + B + C + D + E \\ x^3 \mid 3 = B + C + 2D - 2E \\ x^2 \mid -13 = -5A - 4B - 4C - D - E \\ x \mid 0 = -4B + 4C - 2D + 2E \\ x^0 \mid 4 = 4A \end{array} \right\} \quad (3.10)$$

Natijada,  $A, B, C, D, E$  noma’lumlarga nisbatan beshta chiziqli algebraik tenglamalar sistemasi hosil qilindi. Bu sistemani yechib, noma’lum koeffitsiyentlarni topamiz: bunda,  $A=1$ , (3.10) sistemaning ikkinchisi va to‘rtinchisini birga yechib,  $B=C-1$  ekanligini, birinchi va uchinchisini birga yechib,  $D=-E$  ekanligini topamiz. Bularni e’tiborga olib, to‘rtinchini tenglamadan,  $C=\frac{3}{2}$ ,  $B=\frac{1}{2}$  ekanligini topamiz.

Shunday qilib, noma’lum koeffitsiyentlarning hammasi topildi:

$$A=1, \quad B=\frac{1}{2}, \quad C=\frac{3}{2}, \quad D=1, \quad E=-1.$$

Demak,

$$\begin{aligned}
& \int \frac{x^6 - 2x^4 + 3x^3 - 9x^2 + 4}{x^5 - 5x^3 + 4x} dx = \int \left( x + \frac{3x^4 + 3x^3 - 13x^2 + 4}{x(x-1)(x+1)(x-2)(x+2)} \right) dx = \\
& = \int x dx + \int \frac{dx}{x} + \frac{1}{2} \int \frac{dx}{x-1} + \frac{3}{2} \int \frac{dx}{x+1} + \int \frac{dx}{x-2} - \int \frac{dx}{x+2} = \frac{x^2}{2} + \ln|x| + \\
& + \frac{1}{2} \ln|x-1| + \frac{3}{2} \ln|x+1| + \ln|x-2| - \ln|x+2| + C = \frac{x^2}{2} + \ln \left| \frac{x(x-2)(x+1)\sqrt{|x^2-1}|}{x+2} \right| + C.
\end{aligned}$$

To‘g‘ri rasional kasrlarni noma’lum koeffisientli (3.6) ko‘rinishdagi sodda kasrlar yig‘indisi shaklida tasvirlaganda, undagi noma’lum koeffitsiyentlarni yuqorida ko‘rsatilgan (3.1-misolga qarang), noma’lum koeffitsiyentlar usulidan foydalanib topishda, chiziqli algebrailk tenglamalarni yechishga to‘g‘ri keladi, lekin chiziqli tenglamalar sistemasini yechish, har doim ham engil bo‘lavermaydi. Xususiy hollarda, noma’lum koeffitsiyentlar usuliga qaraganda, qulayroq bo‘lgan, ya’ni noma’lum koeffitsiyentlarni topishda osonroq bo‘lgan, usullar mavjud. Masalan, *Xevisayd usuli*, *Gorner sxemasi*, *differensiallashdan foydalanish usullari*, shular jumlasiga kiradi.

**3.1.1. Xevisayd usuli.** Agar  $\frac{P_m(x)}{Q_n(x)}$  ( $m < n$ ) to‘g‘ri kasrning maxraji  $Q_n(x)$ , ushbu

$$Q_n(x) = a_n(x - \alpha_1)(x - \alpha_2) \dots (x - \alpha_n), a_n = 1, \quad (3.11)$$

ko‘rinishda tasvirlansa,  $\alpha_1, \alpha_2, \dots, \alpha_n$  — haqiqiy sonlar bo‘lib,  $Q_n(\alpha_i) = 0$ , ( $i = \overline{1, n}$ ), uning (3.6) shakldagi sodda kasrlarga yoyilmasidagi koeffitsiyentlarni, Xevisayd usulidan foydalanib, topish maqsadga muvofiq bo‘ladi. Bu usulni, qisqacha, quyidagi tartibda amalga oshiramiz:

*1-qadam.*  $\frac{P_m(x)}{Q_n(x)}$  ( $m < n$ ) to‘g‘ri kasrning maxraji  $Q_n(x)$  ning (3.11) ifodadagi ko‘paytuvchilari orqali yozish, ya’ni

$$\frac{P_m(x)}{Q_n(x)} = \frac{P_m(x)}{(x - \alpha_1)(x - \alpha_2) \dots (x - \alpha_n)}.$$

*2-qadam.*  $Q_n(x)$  ning  $(x - \alpha_i)$  ( $i = \overline{1, n}$ ) ko‘paytuvchisini vaqtincha yopib,  $i$  ning har bir qiymatida yopilmagan ko‘paytuvchilarda  $x$  ni  $\alpha_i$  son bilan almashtiramiz. Bu esa, har bir  $\alpha_i$  ildiz uchun  $A_i$  sonni beradi:

$$A_1 = \frac{P_m(\alpha_1)}{(\alpha_1 - \alpha_2) \dots (\alpha_1 - \alpha_n)},$$

$$A_2 = \frac{P_m(\alpha_2)}{(\alpha_2 - \alpha_1)(\alpha_2 - \alpha_3) \dots (\alpha_2 - \alpha_n)},$$

.....

$$A_n = \frac{P_m(\alpha_n)}{(\alpha_n - \alpha_1)(\alpha_n - \alpha_2) \dots (\alpha_n - \alpha_{n-1})}.$$

*3-qadam.*  $\frac{P_m(x)}{Q_n(x)}$  ( $m < n$ ) rasional kasrni

$$\frac{P_m(x)}{Q_n(x)} = \frac{A_1}{x - \alpha_1} + \frac{A_2}{x - \alpha_2} + \dots + \frac{A_n}{x - \alpha_n}$$

ko‘rinishda yozish.

Misol uchun, bu usulni 3.1 - misolga tatbiq qilsak,  $A, B, C, D, E$  koeffitsiyentlarni osongina topish mumkin:

*1 - qadam.*

$$\frac{P_4(x)}{Q_5(x)} = \frac{3x^4 + 3x^3 - 13x^2 + 4}{x(x-1)(x+1)(x-2)(x+2)}, \quad \alpha_1 = 0, \alpha_2 = 1, \alpha_3 = -1, \alpha_4 = 2, \alpha_5 = -2.$$

*2 - qadam.*

$$A = \frac{4}{(-1) \cdot 1 \cdot (-2) \cdot 2} = 1$$

$$B = \frac{-3}{1 \cdot 2 \cdot (-1) \cdot 3} = \frac{1}{2};$$

$$C = \frac{3 - 3 - 13 + 4}{(-1) \cdot (-2) \cdot (-3) \cdot 1} = \frac{3}{2},$$

$$D = \frac{3 \cdot 16 + 3 \cdot 8 - 13 \cdot 4 + 4}{2 \cdot 1 \cdot 3 \cdot 4} = 1,$$

$$E = \frac{3 \cdot 16 - 3 \cdot 8 - 13 \cdot 4 + 4}{(-2) \cdot (-3) \cdot (-1) \cdot (-4)} = -1.$$

*3 - qadam.* Berilgan  $\frac{P_4(x)}{Q_5(x)}$  tug‘ri kasrni,

$$\begin{aligned} \frac{P_4(x)}{Q_5(x)} &= \frac{A}{x} + \frac{B}{x-1} + \frac{C}{x+1} + \frac{D}{x-2} + \frac{E}{x+2} = \\ &= \frac{1}{x} + \frac{1}{2} \cdot \frac{1}{x-1} + \frac{3}{2} \cdot \frac{1}{x+1} + \frac{1}{x-2} - \frac{1}{x+2} \end{aligned}$$

ko‘rinishda yozamiz.

Ko‘p hollarda  $x$  ning qiymatlarini, masalan,  $x = 0, \pm 1, \pm 2, \dots$  kabilarni, tanlash yordamida ham noma’lum koeffitsiyentlarni topish qulay bo‘лади.

**3.2-misol.**  $x$  ning sonli qiymatlari yordamida

$$\frac{x^2 + 1}{(x-1)(x-2)(x-3)} = \frac{A}{x-1} + \frac{B}{x-2} + \frac{C}{x-3}$$

ifodadagi  $A, B, C$  koeffitsiyentlar topilsin.

**Yechilishi.** Dastlab tenglamada kasrdan qutilamiz:

$$x^2 + 1 = A(x-2)(x-3) + B(x-1)(x-3) + C(x-1)(x-2). \quad (3.12)$$

Endi,  $A, B, C$  koeffitsiyentlarni topish uchun, mos ravishda, (3.12) tenglikda  $x=1, x=2, x=3$ , qiyamatlarni ketma-ket qo'yamiz:

$$1+1=A(-1), (-2), 2=2A, A=1$$

$$2^2+1=-B, B=-5,$$

$$3^2+1=2C, C=5.$$

Natijada,

$$\frac{x^2+1}{(x-1)(x-2)(x-3)(x-4)} = \frac{1}{x-1} - \frac{5}{x-2} + \frac{5}{x-3}$$

bo'ladi.

### 3.3 - misol. Ushbu

$$\frac{x}{x^3+6x^2+11x+6}$$

kasrning noma'lum koeffitsiyentli sodda kasrlar yig'indisi shaklidagi ifodasidagi noma'lum koeffitsiyentlarni toping.

**Yechilishi.** 1-qadam. Berilgan kasrning maxrajini ko'paytuv-chilarga ajratamiz:

$$Q_3(x) = x^3 + 6x^2 + 11x + 6 = (x+1)(x^2 + 5x + 6) = (x+1)(x+2)(x+3).$$

Demak,  $Q_3(x)$  maxraj,  $\alpha_1 = -1, \alpha_2 = -2, \alpha_3 = -3$  sodda haqiqiy ildizlarga ega. Shunga asosan, berilgan kasrni,

$$\frac{x}{x^3+6x^2+11x+6} = \frac{x}{(x+1)(x+2)(x+3)}$$

ko'rinishda yozib olamiz.

#### 2 - qadam.

$$\alpha = -1: \quad A_1 = \frac{-1}{1 \cdot 2} = -\frac{1}{2},$$

$$\alpha_2 = -2: \quad A_2 = \frac{-2}{-1 \cdot 1} = 2,$$

$$\alpha_3 = -3: \quad A_3 = \frac{-3}{2 \cdot (-1)} = -\frac{3}{2}.$$

#### 3 - qadam.

Berilgan kasrni, ushbu

$$\frac{x}{x^3+6x^2+11x+6} = -\frac{1}{2(x+1)} + \frac{2}{x+2} - \frac{3}{2(x+3)}$$

ko'rinishda yozamiz.

### 3.1.2. Differensiallashdan foydalanish usuli.

Bu usulni,  $\frac{P_m(x)}{Q_n(x)}$

( $m < n$ ) to'g'ri kasrning  $Q_n(x)$  maxraji, haqiqiy karrali ildizlarga ega bo'lganda qo'llash qulay bo'ladi.

### 3.4 - misol. Ushbu

$$\frac{x-1}{(x+2)^3} = \frac{A}{x+2} + \frac{B}{(x+2)^2} + \frac{C}{(x+2)^3}$$

tenglamada  $A, B, C$  noma'lum koefisientlarni differensiallashdan foydalanish usuli bo'yicha topish jarayonini batafsil qarab chiqamiz.

**Yechilishi.** *1-qadam.* Dastlab kasrdan qutilamiz:

$$x-1 = A(x+2)^2 + B(x+2) + C \quad (3.13)$$

Bu tenglamada,  $x=-2$  deb olsak,  $C=-3$  bo'lishini topamiz.

*2-qadam.* (3.13) tenglikning ikkala tomonini  $x$  ga nisbatan differensiallab,

$$1 = 2A(x+2) + B \quad (3.14)$$

tenglikni hosil qilamiz. Bunda  $x=-2$  deb olsak,  $B=1$  bo'ladi.

*3-qadam.* Endi (3.14) tenglikning ikkala tomonini  $x$  ga nisbatan differensiallasak, natijada

$$0 = 2A, A = 0$$

bo'ladi.

Demak,

$$\frac{x-1}{(x+2)^3} = \frac{1}{(x+2)^2} - \frac{3}{(x+2)^3}$$

**3.1.3 Gorner sxemasi.** Har qanday  $n$ -darajali

$$P_n(x) = a_n x^n + a_{n-1} x^{n-1} + \dots + a_2 x^2 + a_1 x + a_0 \quad (a_n \neq 0)$$

ko'phadni  $x-\alpha$  ikkihadning darajalari bo'yicha yoyish mumkin:

$$\tilde{P}_n(x) = A_n(x-\alpha)^n + A_{n-1}(x-\alpha)^{n-1} + \dots + A_2(x-\alpha)^2 + A_1(x-\alpha) + A_0,$$

bunda  $A_i (i = \overline{0, n})$  noma'lum koeffitsiyentlar. Gorner sxemasini ketma-ket qo'llash yordamida,  $A_i (i = \overline{0, n})$  noma'lum koeffitsiyentlarni topish jadvalini keltiramiz:

		$x^n$	$x^{n-1}$	$x^{n-2}$	...	X	$x^0$
		$a_n$	$a_{n-1}$	$a_{n-2}$	...	$a_1$	$a_0$
$x^0$	$\alpha$	$a_n$	$\alpha a_n + a_{n-1} = b_{n-1}$	$\alpha b_{n-1} + a_{n-2} = b_{n-2}$	...	$\alpha b_1 + a_1 = b_1$	$\alpha b_1 + a_0 = A_0$
$x^1$	$\alpha$	$a_n$	$\alpha a_n + b_{n-1} = c_{n-1}$	$\alpha c_{n-1} + b_{n-2} = c_{n-2}$	...	$\alpha c_2 + b_1 = A_1$	
$x^2$	$\alpha$	$a_n$	$\alpha a_n + c_{n-1} = d_{n-1}$	$\alpha d_{n-1} + c_{n-2} = d_{n-2}$	...		
$\vdots$	$\vdots$	$\vdots$	$\vdots$	$\vdots$	$\vdots$	$\vdots$	$\vdots$
$x^{n-2}$	$\alpha$	$a_n$	$\alpha a_n + \ell_{n-1} = h_{n-1}$	$\alpha h_{n-1} + \ell_{n-2} = A_{n-2}$			
$x^{n-1}$	$\alpha$	$a_n$	$\alpha a_n + h_{n-1} = A_{n-1}$				

$x^n$	$\alpha$	$a_n = A_n$				
-------	----------	-------------	--	--	--	--

$$P_n(x) = A_n(x - \alpha)^n + A_{n-1}(x - \alpha)^{n-1} + \dots + A_2(x - \alpha)^2 + A_1(x - \alpha_1) + A_0,$$

ko‘phadni  $(x - \alpha)^{n+1}$  ga bo‘lamiz, natijada,  $\frac{P_n(x)}{(x - \alpha)^{n+1}}$  to‘g‘ri rasional kasrni sodda kasrlarga yoygan bo‘lamiz:

$$\frac{P_n(x)}{(x - \alpha)^{n+1}} = \frac{A_n}{x - \alpha} + \frac{A_{n-1}}{(x - \alpha)^2} + \dots + \frac{A_2}{(x - \alpha)^{n-2}} + \frac{A_1}{(x - \alpha)^{n-1}} + \frac{A_0}{(x - \alpha)^{n+1}}$$

**3.5- misol.** Ushbu  $\frac{x^4 - 2x^2 + 3}{(x + 1)^5}$  to‘g‘ri rasional kasrni sodda kasrlarga yoying.

**Yechilishi.** Gorner sxemasidan foydalaniib,  $P_4(x) = x^4 - 2x^2 + 3$  ko‘phadni  $x+1$  ikkihadning darajalari bo‘yicha yoyamiz. Dastlab quyidagi jadvalni tuzamiz:

	$x^4$	$x^3$	$x^2$	$x$	$x^0$
	1	0	-2	0	3
$x^0$	-1	1	-1	-1	$2 = A_0$
$x^1$	-1	1	-2	1	$0 = A_1$
$x^2$	-1	1	-3	$4 = A_2$	
$x^3$	-1	1	$-4 = A_3$		
$x^4$	-1	$1 = A_4$			

Bu jadvalga asosan,  $P_4(x) = (x + 1)^4 - 4(x + 1)^3 + 4(x + 1)^2 + 0(x + 1) + 2$  ko‘phadni tuzamiz. Endi  $P_4(x)$  ko‘phadni  $(x + 1)^5$  ga bo‘lib, berilgan to‘g‘ri rasional kasrni sodda kasrlar orqali yoyilmasiga ega bo‘lamiz:

$$\frac{P_4(x)}{(x + 1)^5} = \frac{1}{x + 1} - \frac{4}{(x + 1)^2} + \frac{4}{(x + 1)^3} + \frac{2}{(x + 1)^5}.$$

**3.6 - misol.** Ushbu

$$\int \frac{4x^2 - 8x}{(x + 1)^2 (x^2 + 1)^2} dx$$

integralni hisoblang.

**Yechilishi. 1 - qadam.** Berilgan integralda  $P_2(x) = 4x^2 - 8x$ ,

$Q_6(x) = (x + 1)^2 (x^2 + 1)^2$ , integral ostidagi funksiya to‘g‘ri kasrdan iborat bo‘lgani uchun, 3.1 - teoremagaga asosan, integral ostidagi to‘g‘ri kasrni quyidagi sodda kasrlar yig‘indisi shaklida tasvirlaymiz:

$$\frac{4x^3 - 8x}{(x+1)^2(x^2+1)^2} = \frac{A}{(x+1)^2} + \frac{B}{(x+1)} + \frac{Dx+E}{(x^2+1)^2} + \frac{Mx+N}{(x^2+1)},$$

bunda  $A, B, C, D, E, M, N$  - noma'lum koeffisientlar.

**2 - qadam.** Oxirgi kasrni umumiy maxrajga keltirish natijasida,

$$4x^3 - 8x = A(x^2 + 1)^2 + B(x+1)(x^2 + 1)^2 + (Dx+E)(x+1)^2 + (Mx+N)(x+1)^2(x^2 + 1) \quad (3.15)$$

munosabatga ega bo'lamiz. (3.15) ning ikki tomonidagi ko'phadlarning mos koeffisientlarini tenglashtirish natijasida, noma'lum  $A, B, C, D, E, M, N$  koeffitsiyentlarga nisbatan chiziqli tenglamalar sistemasi hosil bo'ladi. Lekin, bu sistemani yechishga nisbatan qulayroq (osonroq) usul mavjud bo'lib, u quyidagicha amalga oshiriladi: (3.15) tenglikda  $x = -1$  deb olib,  $A = 3$  ekanligini topamiz. So'ngra,  $x = i$  deb olsak,

$$-4 - 8i = (Di + E)(i+1)^2 = -2D + i2E,$$

bunda haqiqiy va mavhum qiymatlarni tenglashtirib,

$$-4 = -2D, \quad -8 = 2E, \quad D = 2, \quad E = -4$$

larni topamiz.

**3 - qadam.** (3.15) tenglikning ikkala tomonini differensiallab, so'ngra  $x = -1$  da nolga aylanmaydigan hadlarini yozib olamiz:

$$8x - 8 = 4A(x^2 + 1) \cdot x + B(x^2 + 1)^2 + \dots$$

bundan,  $x = -1$  deb olsak,  $-16 = -8A + 4B = -24 + 4B \Rightarrow 8 = 4B; B = 2$  bo'ladi.

**4 - qadam.** (3.15) ning ikkala tomonini differensiallab, faqat  $x = i$  da nolga aylanmaydigan hadlarni yozib olamiz:

$$8x - 8 = D(x+1)^2 + 2(Dx+E)(x+1) + (Mx+N)(x+1)^2 \cdot 2x + \dots$$

Bu tenglikning ikkala tomoniga  $x = i$  ni qo'yib, qolgan ikkita koeffitsiyentlarni topamiz:

$$8i - 8 = 2(i+1)^2 + 2(2i-4)(i+1) + (Mi+N(i+1)^2) \cdot 2i$$

$$8i - 8 = -12 - 4Mi - 4N, \quad 4 - 8i = -4N - 4Mi,$$

$$4 = -4N, \quad -8 = -4M, \quad N = -1, \quad M = 2.$$

**5 - qadam.** Shunday qilib,

$$\begin{aligned} \int \frac{4x^3 - 8x}{(x+1)^2(x^2+1)^2} dx &= \int \left( \frac{A}{(x+1)^2} + \frac{B}{x+1} + \frac{Dx+E}{(x^2+1)^2} + \frac{Mx+N}{x^2+1} \right) dx = \\ &= 3 \int \frac{dx}{(x+1)^2} + 2 \int \frac{dx}{x+1} + 2 \int \frac{x-2}{(x^2+1)^2} dx + \int \frac{2x-1}{x^2+1} dx = \\ &= -\frac{3}{x+1} + 2 \ln|x+1| - \frac{1}{x^2+1} - 4 \int \frac{dx}{(x^2+1)^2} + \ln|x^2+1| - \arctgx. \end{aligned}$$

Oxirgi integral (2.18) rekurrent formula orqali topiladi:

$$\int \frac{dx}{(x^2+1)^2} = \frac{x}{2(x^2+1)} + \frac{1}{2} \arctgx + C.$$

Demak,

$$\int \frac{4x^2 - 8x}{(x+1)^2(x^2+1)^2} dx = -\frac{3}{x+1} - \frac{2x+1}{x^2+1} + \ln(x+1)^2(x^2+1) - 3\arctg x + C.$$

Rasional kasrlarni sodda kasrlarga yoyib integrallashda ko‘p hollarda, murakkab hisoblashlar bajarishga to‘g‘ri keladi. Ba‘zi hollarda, integral ostidagi rasional kasrning shaklini almashtirib, o‘zgaruvchilarni almashtirish, bo‘laklab integrallash usullaridan foydalanish, berilgan integralni hisoblashni yengillashtiradi.

: 3.7 - misol. Quyidagi:

$$\begin{aligned} 1) & \int \frac{dx}{x^2(3+x^2)^2}; \quad 2) \int \frac{dx}{x^2(x^2+2)}; \quad 3) \int \frac{dx}{x(2-x^2)^2}; \\ 4) & \int \frac{x^2+1}{x^4+3x^2+1}; \quad 5) \int \frac{x^2 dx}{(x^2+3)^3}; \\ 6) & \frac{1}{x^4(1+x^2)}; \quad 7) \frac{2x^9+3x^4}{(x^{10}+1)^2} \end{aligned}$$

integrallarni hisoblang.

Yechilishi.

$$\begin{aligned} 1) & \int \frac{dx}{x^2(3+x^2)^2} = \frac{1}{3} \int \frac{3-x^2+x^2}{x^2(3+x^2)^2} dx = \frac{1}{3} \int \frac{dx}{x^2(3+x^2)} - \frac{1}{3} \int \frac{dx}{(3+x^2)^2} = \\ & = \frac{1}{9} \int \left( \frac{1}{x^2} - \frac{1}{3+x^2} \right) dx - \frac{1}{3} \int \frac{dx}{(3+x^2)^2} = \\ & = -\frac{1}{9x} - \frac{1}{9\sqrt{3}} \arctg \frac{x}{\sqrt{3}} - \frac{x}{18(x^2+3)} - \frac{1}{18\sqrt{3}} \arctg \frac{x}{\sqrt{3}} = \\ & = -\frac{1}{9x} - \frac{x}{18(x^2+3)} + \frac{1}{6\sqrt{3}} \arctg \frac{x}{\sqrt{3}} + C \\ 2) & \int \frac{dx}{x^3(x^2+2)} = \int \frac{x dx}{x^4(x^2+2)} = \frac{1}{2} \int \frac{d(x^2)}{x^4(x^2+2)} = \frac{1}{2} \int \frac{du}{u^2(u+2)} \Big|_{u=x^2} = \\ & = \frac{1}{2} \int \frac{u+2-u}{u^2(u+2)} du = \frac{1}{2} \int \frac{du}{u^2} - \frac{1}{2} \int \frac{du}{u(u+2)} = \\ & = -\frac{1}{2u} - \frac{1}{4} \ln|u| + \frac{1}{4} \ln|u+2| + C = -\frac{1}{2x^2} + \frac{1}{4} \ln \frac{x^2+2}{x^2} + C. \\ 3) & \int \frac{dx}{x(2-x^2)^2} = \int \frac{x^2 dx}{x^3(2-x^2)^2} = \frac{1}{3} \int \frac{d(x^3)}{x^3(2-x^2)^2} = \frac{1}{3} \int \frac{du}{u(2-u)^2} \Big|_{u=x^3} = \\ & = \frac{1}{6} \int \frac{1}{2-u} \left( -\frac{1}{u} + \frac{1}{2-u} \right) du = \frac{1}{6} \int \frac{du}{(2-u)^2} - \frac{1}{12} \int \frac{du}{2-u} + \frac{1}{12} \int \frac{du}{u} = \\ & = \frac{1}{6(2-u)} - \frac{1}{12} \ln|2-u| + \frac{1}{12} \ln|u| + C = \frac{1}{6(2-x^3)} + \frac{1}{12} \ln \left| \frac{x^3}{2-x^3} \right| + C \end{aligned}$$

$$\begin{aligned}
4) \int \frac{x^2+1}{x^4+3x^2+1} dx &= \int \frac{x^2 \left(1 + \frac{1}{x^2}\right)}{x^2 \left(x^2 + 3 + \frac{1}{x^2}\right)} dx = \int \frac{d\left(\frac{x-1}{x}\right)}{\left(\frac{x-1}{x}\right)^2 + 5} dx = \\
&= \int \frac{du}{u^2 + 5} \Bigg|_{u=\frac{x-1}{x}} = \left( \frac{1}{\sqrt{5}} \operatorname{arctg} \frac{u}{\sqrt{5}} + C \right) \Bigg|_{u=\left(\frac{x-1}{x}\right)} = \frac{1}{\sqrt{5}} \operatorname{arctg} \frac{x^2-1}{x\sqrt{5}} + C. \\
5) \int \frac{x^2 dx}{(x^2+3)^3} &= \int \frac{x \cdot x dx}{(x^2+3)^3} = \frac{1}{3} \int \frac{x d(x^2+3)}{(x^2+3)^3} = \\
&\left[ u = x, \quad dv = \frac{d(x^2+3)}{(x^2+3)^3}, \quad du = dx, \quad v = -\frac{1}{2(x^2+3)^2} \right] \\

6) \int \frac{1}{x^4(1+x^2)} dx &= \int \frac{1-x^4+x^4}{x^4(1+x^2)} dx = \int \frac{(1-x^2)(1+x^2)+x^4}{x^4(1+x^2)} dx = \\
&= \int \frac{1-x^2}{x^4} dx + \int \frac{dx}{1+x^2} = -\frac{1}{3x^3} + \frac{1}{x} + \operatorname{arctgx} + C \\
7) \int \frac{2x^9+3x^4}{(x^{10}+1)^2} dx &= \frac{1}{5} \int \frac{d(x^{10}+1)}{(x^{10}+1)^2} + \frac{3}{5} \int \frac{dx^5}{((x^5)^2+1)^2} = \frac{1}{5} \int \frac{du}{u^2} \Bigg|_{u=x^{10}+1} + \frac{3}{5} \int \frac{du}{(u^2+1)^2} \Bigg|_{u=x^5} = \\
&= -\frac{1}{5(x^{10}+1)} + \frac{x^5}{2(x^5+1)} + \frac{1}{2} \operatorname{arctgx}^5 + C.
\end{aligned}$$

**3.2. Integralning rasional qismini ajratishda Ostrogradskiy usuli.**  $\frac{P(x)}{Q(x)}$  to‘g‘ri kasrnning maxraji karrali kompleks ildizlarga ega bo‘lganda, uni integrallashda, murakkab hisoblashlar bajarishga to‘g‘ri keladi.

Bunday hollarda, ushbu

$$\int \frac{P(x)}{Q(x)} dx = \frac{P_1(x)}{Q_1(x)} + \int \frac{P_2(x)}{Q_2(x)} dx \quad (3.16)$$

Ostrogradskiy formulasidan foydalanish qulay bo‘ladi, bunda  $Q_2(x)$  – ildizlari  $Q(x)$  ko‘phadning hamma sodda (bir karrali) ildizlaridan

iborat bo‘lgan ko‘phad,  $Q(x) = Q_1(x) \cdot Q_2(x)$ ,  $P_1(x)$  va  $P_2(x)$  lar no‘malum koeffisientli ko‘phadlar bo‘lib,  $\frac{P_1(x)}{Q_1(x)}$  va  $\frac{P_2(x)}{Q_2(x)}$  –to‘g‘ri kasrlardan iborat.

$P_1(x)$  va  $P_2(x)$  ko‘phadlarni topish uchun, ularni no‘malum koeffitsiyentlar yordamida yozib olib, so‘ngra, (3.16) ning ikkala tomonini differensiallaysiz, natijada, (3.16) tenglikka teng kuchli,

$$\frac{P(x)}{Q(x)} = \left( \frac{P_1(x)}{Q_1(x)} \right)' + \frac{P_2(x)}{Q_2(x)} \quad (3.17)$$

tenglikga ega bo‘lamiz. Bu tenglikdan noma’lum koeffitsiyentlar usulidan foydalanimiz,  $P_1(x)$  va  $P_2(x)$  larning tarkibidagi noma’lum koeffitsiyentlarni topamiz. Ostrogradskiy formulasi, integralning rasional qismini (integrallamasdan) ajratishga imkon beradi,  $\frac{P(x)}{Q(x)}$  to‘g‘ri kasrni integrallash masalasi, unga nisbatan osonroq integrallananidigan  $\frac{P_2(x)}{Q_2(x)}$  to‘g‘ri kasrni integrallashga keltiriladi.

**3.8-misol.** Ushbu  $\int \frac{x-1}{(x^2+x+1)^2} dx$  integralni hisoblang.

**Yechilishi.** Bu holda,  $P(x) = x - 1$ ,  $Q(x) = (x^2 + x + 1)^2$ ,  $Q_1(x) = x^2 + x + 1$ ,  $Q_2(x) = x^2 + x + 1$ . (1) formulaga asosan,

$$\int \frac{x-1}{(x^2+x+1)^2} dx = \frac{Ax+B}{x^2+x+1} + \int \frac{Cx+D}{x^2+x+1} dx$$

deb yozib olamiz.  $A, B, C, D$  noma’lum koeffitsiyentlarni topish uchun, yuqoridaq tenglikning ikkala tomonini differensiallaysiz:

$$\begin{aligned} \frac{x-1}{(x^2+x+1)^2} &= \left( \frac{Ax+B}{x^2+x+1} \right)' + \frac{Cx+D}{x^2+x+1}, \\ \frac{x-1}{(x^2+x+1)^2} &= \frac{A(x^2+x+1)-(Ax+B)(2x+1)}{(x^2+x+1)^2} + \frac{Cx+D}{x^2+x+1}. \end{aligned}$$

bundan

$$x-1 = A(x^2+x+1) - (Ax+B)(2x+1) + (Cx+D)(x^2+x+1).$$

Tenglikning ikkala tomonidagi  $x$  ning bir xil darajalari oldidagi koeffitsiyentlarni tenglashtiramiz:

$$x^3 | 0 = C,$$

$$x^2 | 0 = A - 2A + C + D,$$

$$x | 1 = A - A - 2B + C + D,$$

$$x^0 | -1 = A - B + D,$$

bundan,  $C = 0$ ,  $A = D = B = -1$ .

Shunday qilib,

$$\begin{aligned} \int \frac{x-1}{(x^2+x+1)^2} dx &= -\frac{x+1}{x^2+x+1} - \int \frac{dx}{\left(x+\frac{1}{2}\right)^2 + \left(\frac{\sqrt{3}}{2}\right)^2} = \\ &= -\frac{x+1}{x^2+x+1} - \frac{2}{\sqrt{3}} \operatorname{arctg} \frac{2x}{\sqrt{3}} + C. \end{aligned}$$

#### 4-§. Ba'zi irrasional ifodalarni integrallash

Agar integral ostidagi funksiya irrasional funksiya bo'lsa, ba'zi hollarda uning integralini hisoblash masalasi, rasional funksiyaning integralini hisoblashga olib kelinadi. Bu usulga integral ostidagi ifodani *rasionallashtirish usuli* deyiladi. Biz bu paragrafda irrasional ifodalar qatnashgan integrallarning ba'zi turlarini rasionallashtirish usullarini keltiramiz.  $x_1, x_2, \dots, x_n$  o'zgaruvchilarga nisbatan rasional bo'lgan funksiyani  $R(x_1, x_2, \dots, x_n)$  deb belgilaymiz.

##### 4.1. $\int R(x, x^\alpha, x^\beta, \dots, x^\nu) dx$ ko'rinishdagi ifodalarni integrallash.

Bunda  $R(x, x^\alpha, x^\beta, \dots, x^\nu)$ - o'z argumentlarining rasional funksiyasi,  $\alpha = \frac{m_1}{n_1}, \beta = \frac{m_2}{n_2}, \dots, \nu = \frac{m_k}{n_k}$  - rasional sonlar. Bu integralni hisoblash,  $x = t^k (k - n_1, n_2, \dots)$  larning eng kichik umumiy bo'linuvchisi) almashtirish yordamida rasional funksiyaning integralini hisoblashga keltiriladi.

**4.1-misol.** Ushbu  $\int \frac{x + \sqrt[4]{x}}{x(1 + \sqrt[4]{x})} dx$  integralni hisoblang.

**Yechilishi.** Integral ostidagi funksiya,  $x_1 = x, x_2 = x^{\frac{1}{3}}, x_3 = x^{\frac{1}{6}}$  o'zgaruvchilarga nisbatan rasional funksiya. Berilgan integral 4.1-banddag'i integral ko'rinishida bo'lib,  $\alpha = \frac{1}{3}, \beta = \frac{1}{6}, n_1 = 3, n_2 = 6, k = 6$ . Uni hisoblash, 4.1- bandga asosan,  $x = t^6$  almashtirish yordamida rasional funksiyaning integralini hisoblashga keltiriladi:  $dx = 6t^5 dt$ ,

$$\begin{aligned} \int \frac{x + \sqrt[4]{x}}{x(1 + \sqrt[4]{x})} dx &= \int \frac{t^6 + t}{t^6(1 + t^{\frac{1}{2}})} 6t^5 dt = 6 \int \frac{t^5 + 1}{1 + t^{\frac{1}{2}}} dt = 6 \int (t^{\frac{5}{2}} + 1) dt + 6 \int \frac{t^{\frac{1}{2}} + 1}{1 + t^{\frac{1}{2}}} dt = \\ &= \frac{3}{2} t^4 + 3t^3 + 6 \operatorname{arctg} t + 3 \ln(1+t) + C = \frac{3}{2} \sqrt{x^2} + 3\sqrt{x} + 6 \operatorname{arctg} \sqrt{x} + 3 \ln(\sqrt{x}) + C. \end{aligned}$$

$$4.2. \int R[x, (ax+b)^\alpha, (ax+b)^\beta, \dots, (ax+b)^\nu] dx, \quad (4.1)$$

$$\int R[x, \left(\frac{ax+b}{cx+d}\right)^\alpha, \left(\frac{ax+b}{cx+d}\right)^\beta, \dots, \left(\frac{ax+b}{cx+d}\right)^\nu] dx \quad (a, b, c, d \in R, ad - cb \neq 0) \quad (4.2)$$

**ko‘rinishdagi ifodalarni integrallash.** (4.1) yoki (4.2) ko‘rinishdagi integrallar, mos ravishda,  $ax + b = t^k$  yoki  $\frac{ax+b}{cx+d} = t^k$  almashtirish yordamida rasionallashtiriladi, bunda  $k = \alpha, \beta, \dots, \nu$  rasional sonlarning eng kichik umumiy bo‘linuvchisi.

**4.2-misol.** Ushbu  $\int \frac{1}{x} \sqrt{\frac{x-2}{x}} dx$  integralni hisoblang.

**Yechilishi.** Berilgan integral (4.2) ko‘rinishdagi integral bo‘lib,  $\frac{x-2}{x} = t^2$  almashtirish yordamida rasionallashtirilib, hisoblanadi:

$$\begin{aligned} \int \frac{1}{x} \sqrt{\frac{x-2}{x}} dx &= \left| x = \frac{2}{1-t^2}, \quad dx = \frac{4t}{(1-t^2)^2} dt \right| = 2 \int \frac{t^2(1-t^2)}{(1-t^2)^2} dt = -2 \int dt + 2 \int \frac{1}{1-t^2} dt = \\ &= -2t - \ln \left| \frac{1-t}{1+t} \right| + C = -2 \sqrt{\frac{x-2}{x}} - \ln \left| x \left( 1 - \sqrt{\frac{x-2}{x}} \right)^2 \right| + C. \end{aligned}$$

**4.3.**  $\int R(x, \sqrt{a^2 - x^2}) dx, \int R(x, \sqrt{a^2 + x^2}) dx, \int R(x, \sqrt{x^2 - a^2}) dx$  ko‘rinishdagi ifodalarni integrallash.

Quyidagi:  $\int R(x, \sqrt{a^2 - x^2}) dx, \int R(x, \sqrt{a^2 + x^2}) dx, \int R(x, \sqrt{x^2 - a^2}) dx$  (4.3) ko‘rinishdagi integrallar, mos ravishda  $x = a \sin t, x = a \operatorname{tg} t, x = a \sec t, a \in R, a \neq 0$ , almashtirishlar natijasida rasionallashtirilib, hisoblanadi.

**4.3 -misol.** Ushbu  $\int x^2 \sqrt{4-x^2} dx$  integralni hisoblang.

**Yechilishi.** Berilgan integral (4.3) ko‘rinishdagi ifodalarning birinchi integrali ko‘rinishida bo‘lganligi uchun,  $x = 2 \sin t$  almashtirishni bajarib, hisoblaymiz:

$$\begin{aligned} \int x^2 \sqrt{4-x^2} dx &= \left| x = 2 \sin t, \quad dx = 2 \cos t dt, \quad \sqrt{4-4 \sin^2 t} = 2 \cos t \right| = \\ &= 16 \int \sin^2 t \cos^2 t dt = 4 \int \sin^2 2t dt = 2 \int (1 - \cos 4t) dt = 2t - \frac{1}{2} \sin 4t + C. \end{aligned}$$

$$\sin 4t = 2\sqrt{1-\sin^2 t} \sin t (1-2\sin^2 t), \quad -\frac{\pi}{2} \leq t \leq \frac{\pi}{2}, \quad \sin \left( \arcsin \frac{x}{2} \right) = \frac{x}{2}, \quad -2 \leq x \leq 2$$

formulalarni e’tiborga olgan holda, eski o‘zgaruvchiga qaytib, integralni hisoblaymiz:

$$\int x^2 \sqrt{4-x^2} dx = 2t - \frac{1}{2} \sin 4t + C = 2 \arcsin \frac{x}{2} + \frac{x}{4} (x^2 - 2) \sqrt{4-x^2} + C.$$

**4.4.**  $\int R(x, \sqrt{ax^2 + bx + c}) dx$  ( $a \neq 0, b^2 - 4ac \neq 0$ ) ko‘rinishdagi ifodalarni integrallash.

Quyidagi:  $\int R(x, \sqrt{ax^2 + bx + c}) dx$  (4.3)

integralni hisoblash, undagi  $a, b, c$  koefisientlarga bog'liq, uchta almashtirish yordamida rasional funksiyaning integralini hisoblashga keltiriladi:

**1-hol.**  $a > 0$  bo'lganda, (4.3) integralda  $\sqrt{ax^2 + bx + c} = \pm t \pm \sqrt{ax}$  almashtirish bajariladi.

**2-hol.**  $c > 0$  bo'lganda, (4.3) integralda  $\sqrt{ax^2 + bx + c} = \pm xt \pm \sqrt{c}$  almashtirish bajariladi.

**3-hol.**  $a \neq 0, b^2 - 4ac > 0$  bo'lganda esa, (4.3) integralda  $\sqrt{ax^2 + bx + c} = t(x - x_1)$  yoki  $\sqrt{ax^2 + bx + c} = t(x - x_2)$  almashtirish bajariladi.

Odatda, yuqorida keltirilgan uchta almashtirishlar - *Eyler almashtirishlari* deb aytildi.

**4.4 -misol.** Ushbu  $\int \frac{dx}{(1+x)\sqrt{1+x-x^2}}$  integralni hisoblang.

**Yechilishi.**  $1+x-x^2$  kvadrat uchhad kompleks ildizga ega va  $a < 0, c > 0$  bo'lgani uchun, **2-holga** asosan,  $\sqrt{1+x-x^2} = tx - 1$  almashtirishni bajaramiz:

$$1+x-x^2 = t^2x^2 - 2tx + 1; 1-x = t^2x - 2t; x = \frac{1+2t}{1+t^2},$$

$$dx = \frac{2(1-t-t^2)}{(1+t^2)^2} dt, \sqrt{1+x-x^2} = \frac{t^2+t-1}{t^2+1}$$

Shunday qilib

$$\begin{aligned} \int \frac{dx}{(1+x)\sqrt{1+x-x^2}} &= \int \frac{2(1-t-t^2)}{(1+t^2)^2 \left(1 + \frac{1+2t}{t^2+1}\right) \cdot \left(\frac{t^2+t-1}{t^2+1}\right)} dt = \\ &= -2 \int \frac{dt}{(t+1)^2 + 1} = -2 \arctg(t+1) + C = -2 \arctg \frac{\sqrt{1+x-x^2} + x + 1}{x} + C \end{aligned}$$

**4.5 -misol.** Ushbu  $\int \frac{x - \sqrt{x^2 + 3x + 2}}{x + \sqrt{x^2 + 3x + 2}} dx$  integralni hisoblang.

**Yechilishi.** Integral ostidagi  $x^2 + 3x + 2$  kvadrat uchhad  $x_1 = -1, x_2 = -2$  haqiqiy ildizlaga ega bo'lgani uchun, 4.4 - banddagи **3-holga** asosan,  $\sqrt{x^2 + 3x + 2} = t(x+1)$  almashtirish bajarib, berilgan integralni hisoblaymiz:

$$(x+1)(x+2) = t^2(x+1)^2; x+2 = t^2(x+1); x = \frac{t^2-2}{1-t^2};$$

$$dx = \frac{2t(1-t^2) + 2t(t^2-2)}{(1-t^2)^2} dt = \frac{2t-4t}{(1-t^2)^2} dt = -\frac{2t}{(1-t^2)^2} dt;$$

$$\int \frac{x - \sqrt{x^2 + 3x + 2}}{x + \sqrt{x^2 + 3x + 2}} dx = \int \frac{x^2 + x^2 - 3x - 2}{(x + \sqrt{x^2 + 3x + 2})^2} dt = - \int \frac{3x + 2}{(x + \sqrt{x^2 + 3x + 2})^2} dx =$$

$$= 2 \int \frac{\left( \frac{3t^2 - 6}{1-t^2} + 2 \right) t \, dt}{\left( 1-t^2 \right) \left[ \frac{t^2 - 2}{1-t^2} + t \left( \frac{t^2 - 2}{1-t^2} + 1 \right) \right]^2} = 2 \int \frac{\frac{t(t^2 - 4)}{1-t^2}}{\left( 1-t^2 \right)^2 \left[ \frac{t^2 - t - 2}{1-t^2} \right]^2} \, dt =$$

$$= 2 \int \frac{t(t^2 - 4) \, dt}{(1-t^2)(t+1)^2(t-2)^2} = 2 \int \frac{t(t+2)}{(1-t^2)(t+1)^2(t-2)} \, dt = 2 \int \frac{t(t+2)}{(1-t)(1+t)^2(t-2)} \, dt$$

Oxirgi integralda, integral ostidagi ifoda to‘g‘ri kasr bo‘lganligi uchun, 3.1 – teoremagaga asosan, uni, sodda kasrlar yig‘indisi shaklida,

$$\frac{2t(t+2)}{(1-t)(1+t)^2(t-2)} = \frac{A}{1-t} + \frac{B}{t-2} + \frac{C}{1+t} + \frac{D}{(1+t)^2} + \frac{E}{(1+t)^3}$$

ko‘rinishda tasvirlab,  $A, B, C, D, E$  noma’lum koeffitsiyentlarni topamiz. Yuqoridagi tenglikdan,

$$2t(t+2) = A(t-2)(1+t)^3 + B(1-t)(1+t)^3 + C(1-t)(2-t)(1+t)^2 + \\ + D(1-t)(1+t)(t-2) + E(1-t)(t-2)$$

munosabatni hosil qilamiz. Oxirgi tenglikda  $t=1, t=-1, t=2$  qiymatlarni ketma-ket qo‘yib,  $A = -\frac{3}{4}, E = \frac{1}{3}, B = -\frac{16}{27}$  ekanligini topamiz.  $D$  koeffitsiyentni topish uchun,

$$2t(t+2) = A(t-2)(1+t)^3 + B(1-t)(1+t)^3 + C(1-t)(2-t)(1+t)^2 + \\ + D(1-t)(1+t)(t-2) + E(1-t)(t-2)$$

tenglikning ikkala tomonini differensiallab, so‘ngra unga  $t=-1$  ni keltirib qo‘yamiz. Differensiallanganda tenglikning o‘ng tomonida  $t=-1$  da nulga aylanmaydigan hadlarni yozib olamiz:

$$4t+4 = D[-2(t-2)] + E[-(t-2)+(1-t)]$$

Bundan  $t=-1$  deb,  $0 = -6D + 5E = -6D + \frac{5}{3}, D = \frac{5}{18}$  ekanligini topamiz.

Xuddi shunday,  $C$  koeffitsiyentni topishda ham,

$$2t(t+2) = A(t-2)(1+t)^3 + B(1-t)(1+t)^3 + C(1-t)(2-t)(1+t)^2 + \\ + D(1-t)(1+t)(t-2) + E(1-t)(t-2)$$

tenglikning ikkala tomonini differensiallab, tenglikning o‘ng tomonida  $t=1$  da nolga aylanmadigan hadlarni yozib olamiz:

$$4t+4 = A[(1+t)^3 + 3(t-2)(1+t)^2] + B[-(1+t)^3] + C[-(t-2)(1+t)^2] + \\ + D[-(1+t)(t-2)] - E(t-2)$$

Bundan,  $t=1$  deb olib,

$$8 = -4A - 8B + 4C + 2D + E = 3 + \frac{128}{27} + 4C + \frac{5}{9} + \frac{1}{3}, C = -\frac{17}{108} \text{ bo‘lishini topamiz.}$$

Demak,

$$\int \frac{x - \sqrt{x^2 + 3x + 2}}{x + \sqrt{x^2 + 3x + 2}} \, dx = \frac{3}{4} \ln|x-1| - \frac{16}{27} \ln|t-2| - \frac{17}{108} \ln|1+t| - \frac{5}{18(t+1)} - \frac{1}{6(t+1)^2} + C,$$

$$\text{bunda, } t = \frac{\sqrt{x^2 + 3x + 2}}{x+1}.$$

#### 4.5. Binomial differensiallarni integrallash.

**4.1-ta'rif.** Ushbu  $x^m(a+bx^n)^p dx$ -ko'rinishdagi ifodaga, *binomial differensial* deyiladi, bunda  $a, b$  - haqiqiy sonlar,  $m, n, p$  - lar esa, rasional sonlar.

$$\int x^m(a+bx^n)^p dx \quad (4.4)$$

ko'rinishdagi integralni hisoblash, quyidagi uchta holda, rasional funksiyani integrallashga keltiriladi:

*1-hol.*  $p$ - butun son. Bu holda  $m, n$  kasr sonlar maxrajining eng kichik umumiy bo'linuvchisini  $\lambda$  orqali belgilab, (4.4) integralda  $x=t^\lambda$  almashtirish bajarilsa, integral ostidagi ifoda rasional ifodaga aylanib, (4.4) integral rasional funksiyani integrallashga keltiriladi.

*2-hol.*  $\frac{m+1}{n}$ - butun son. Bu holda (4.4) integralda  $a+bx^n = t^s$ , ( $s$  son  $-p$  kasrning maxraji) almashtirish bajarilsa, integral ostidagi ifoda rasional ifodaga aylanib, (4.4) integralni hisoblash rasional funksiyani integrallashga keltiriladi.

*3-hol.*  $\frac{m+1}{n} + p$ -butun son bo'lsin. Bu holda (4.4) integralda,  $t^s = ax^{-n} + b$  ( $s$  son  $-p$  kasrning maxraji) almashtirish bajarilishi natijasida rasional funksiya integralini hisoblashga keltiriladi.

#### 4.6-misol. $\int \sqrt{x}(1+\sqrt[3]{x})^4 dx$ integralni hisoblang.

**Yechilishi.** Integral ostidagi ifoda binomial differensial shaklidagi ifoda bo'lib, bunda  $m=\frac{1}{2}, n=\frac{1}{3}, p=4$ .  $p$ -butun bo'lganligi uchun, 4.5 - banddagisi *1-holga* asosan,  $t=\sqrt[3]{x}, x=t^6$  almashtirish olinsa, integral ostidagi ifoda rasional ko'rinishga keladi:

$$\begin{aligned} \int \sqrt{x}(1+\sqrt[3]{x})^4 dx &= \int t^3(1+t^2)^4 6t^5 dt = 6 \int t^8(1+4t^2+6t^4+4t^6+t^8) dt = \\ &= 6 \left( \frac{t^9}{9} + \frac{4 \cdot t^{11}}{11} + 6 \cdot \frac{t^{13}}{13} + 4 \cdot \frac{t^{15}}{15} + \frac{t^{17}}{17} \right) + C = \\ &= \frac{2}{3} t^9 + \frac{24}{11} t^{11} + \frac{36}{13} t^{13} + \frac{8}{5} t^{15} + 6 \cdot \frac{t^{17}}{17} + C = \\ &= \frac{2}{3} x \sqrt{x} + \frac{24}{11} x \sqrt[4]{x^5} + \frac{36}{13} x^2 \sqrt[6]{x} + \frac{8}{5} x^2 \sqrt{x} + \frac{6}{17} x^2 \sqrt[6]{x^5} + C. \end{aligned}$$

#### 4.7-misol. $\int \frac{\sqrt{1-x^4}}{x^5} dx$ integralni hisoblang.

**Yechilishi.** Bu holda,  $m = -5$ ,  $n = 4$ ,  $p = \frac{1}{2}$  bo'lib,  $\frac{m+1}{n} = \frac{-5+1}{4} = -1$  butun bo'lgani uchun, 4.5 - banddagi 2-holga asosan,  $1-x^4=t^2$  almashtirish olinib, integral ostidagi ifoda rasionallashtiriladi:

$$\begin{aligned} \int \frac{\sqrt{1-x^4}}{x^5} dx &= \int x^{-5}(1-x^4)^{\frac{1}{4}} dx = [x = (1+t^2)^{\frac{1}{4}}, dx = -\frac{1}{2}(1-t^2)^{\frac{3}{4}} t dt] = \\ &= -\frac{1}{2} \int \frac{t^2 dt}{(1-t^2)^{\frac{3}{4}} (1-t^2)^{\frac{3}{4}}} = -\frac{1}{2} \int \frac{t^2}{(1-t^2)^2} dt = \\ &= \frac{1}{2} \int \frac{1-t^2-1}{(1-t^2)^2} dt = \frac{1}{2} \int \frac{dt}{1-t^2} - \frac{1}{2} \int \frac{dt}{(1-t^2)^2} = \\ &= -\frac{1}{4} \ln|1-t| + \frac{1}{4} \ln|1+t| + \frac{1}{8} \ln|1-t| - \frac{1}{8(1-t)} - \frac{1}{8} \ln|1+t| + C = \\ &= \frac{1}{8} \ln \left| \frac{1+t}{1-t} \right| + \frac{1}{8(1+t)} = \frac{1}{8} \ln \left| \frac{1+t}{1-t} \right| - \frac{1}{8} \cdot \frac{t}{1-t^2} + C \end{aligned}$$

bunda,  $t = \sqrt{1-x^4}$

**4.8-misol.**  $\int \sqrt[3]{x(1-x^2)} dx$  integralni hisoblang.

**Yechilishi.** Berilgan integralda  $m = \frac{1}{3}$ ,  $n = 2$ ,  $p = \frac{1}{3}$ ,  $\frac{m+1}{n} + p = 1$  butun bo'lgani uchun, 4.5 -banddagi 3- holga asosan,  $\frac{1}{x^2}-1=t^3$  almashtirish bajarib, hisoblaymiz:

$$\begin{aligned} \int \sqrt[3]{x(1-x^2)} dx &= \int x^{\frac{1}{3}}(1-x^2)^{\frac{1}{3}} dx = \left| \begin{array}{l} x^2 = \frac{1}{1+t^3}, x = \sqrt[3]{\frac{1}{1+t^3}}, \\ dx = -\frac{3}{2} \left( \frac{1}{t^3+1} \right)^{\frac{1}{2}} t^2 dt \end{array} \right| = \\ &= -\int (1+t^3)^{\frac{1}{6}} \cdot \frac{t}{(1+t^3)^{1/3}} \cdot \frac{3}{2} t^2 \left( \frac{1}{t^3+1} \right)^{\frac{1}{2}} dt = \\ &= -\frac{3}{2} \int \frac{t^3}{(1+t^3)^{\frac{1}{6}+\frac{1}{3}/2}} dt = -\frac{3}{2} \int \frac{t^3}{(1+t^3)^2} dt = \\ &= -\frac{3}{2} \int \frac{dt}{1+t^3} + \frac{3}{2} \int \frac{dt}{(1+t^3)^2} = -\frac{3}{2} \int \frac{dt}{(1+t)(t^2-t+1)} + \frac{3}{2} \int \frac{dt}{(1+t)^2(t^2-t+1)^2} \end{aligned}$$

Oxirgi integrallarda, integral ostidagi ifodalar to'g'ri kasr bo'lgani uchun, ularni noma'lum koefisientli sodda kasrlar yig'indisi shaklida tasvirlab, so'ngra noma'lum koefisientlarni topib, sodda kasrni integrallash usulidan foydalanib, integrallarni hisoblaymiz:

$$\frac{1}{(1+t)(t^2-t+1)} = \frac{A}{1+t} + \frac{Bt+C}{t^2-t+1},$$

bunda,  $1 = A(t^2 - t + 1) + (Bt + C) \cdot (1+t)$ ,  $1 = A(t^2 - t + 1) + (Bt + C) \cdot (1+t)$  tenglikda  $t = -1$  deb,  $A = \frac{1}{3}$  ekanligini topamiz.  $t$  ning bir xil darajalari oldidagi koefisientlarni tenglashtirib, quyidagi

$$t^2 : 0 = A + B$$

$$t : 0 = -A + B + C$$

$$t^0 : 1 = A + C$$

sistemani hosil qilamiz. Bundan,  $C = \frac{2}{3}$ ,  $B = -\frac{1}{3}$  bo'lishi kelib chiqadi.

Xuddi shunday,

$$\frac{1}{(1+t)^2(t^2 - t + 1)^2} = \frac{A}{1+t} + \frac{B}{(1+t)^2} + \frac{Ct + D}{t^2 - t + 1} + \frac{Mt - N}{(t^2 - t + 1)^2}$$

va

$1 = A(1+t)(t^2 - t + 1)^2 + B(t^2 - t + 1)^2 + (ct + D)(1+t)^2(t^2 - t + 1) + (Mt + N)(1+t)^2$  tenglikni hosil qilamiz.

Oxirgi tenglikda  $t = -1$  deb,  $B = \frac{1}{3}$  ekanligini topamiz.

$1 = A(1+t)(t^2 - t + 1)^2 + B(t^2 - t + 1)^2 + (ct + D)(1+t)^2(t^2 - t + 1) + (Mt + N)(1+t)^2$  tenglikning ikki tomonini differensiallab,  $t = -1$  da nulga aylanmaydigan hadlarni yozib olamiz:

$$0 = A(t^2 - t + 1)^2 + B2(2t - 1)(t^2 - t + 1) + \dots$$

Bundan  $t = -1$  deb olsak,  $0 = 9A - 18B$ ,  $A = \frac{2}{3}$  bo'lishi kelib chiqadi.

$1 = A(1+t)(t^2 - t + 1)^2 + B(t^2 - t + 1)^2 + (ct + D)(1+t)^2(t^2 - t + 1) + (Mt + N)(1+t)^2$  tenglikning ikkala tomonidagi  $t$  ning bir xil darajalari oldidagi koefitsiyentlarni tenglashtiramiz va

$$t^5 : 0 = A + C$$

$$t^4 : 0 = -A + B + C + L$$

$$t^3 : 0 = A - 2B + D + M$$

$$t^2 : 0 = A + 3B + D + 2M + N$$

$$t : 0 = -A - 2B + C + D + M + 2N$$

$$t^0 : 1 = A + B + D + N$$

sistemani hosil qilamiz. Bu sistemadan,  $C = -\frac{2}{3}$ ,  $D = 1$ ,  $M = -1$ ,  $N = -1$  qiymatlarni topamiz.

Demak,

$$\begin{aligned} \int \frac{dt}{(1+t)^2(t^2-t+1)^2} &= \frac{2}{3} \ln|1+t| - \frac{1}{3(1+t)} - \frac{1}{3} \int \frac{d(t^2-1)}{(t^2-t+1)} + \frac{2}{3} \int \frac{dt}{t^2+t+1} - \\ &- \frac{1}{2} \int \frac{d(t^2-t+1)}{(t^2-t+1)^2} + \frac{1}{2} \int \frac{dx}{(t^2-t+1)^2} = \frac{2}{3} \ln|1+t| - \frac{1}{3(1+t)} - \\ &- \frac{1}{3} \ln|t^2-t+1| + \frac{2}{3} \cdot \frac{2}{\sqrt{3}} \operatorname{arctg} \frac{2}{\sqrt{3}} \left( t - \frac{1}{2} \right) + \frac{1}{2\sqrt{3}} \cdot \frac{\left( t - \frac{1}{2} \right)}{\left( t - \frac{1}{2} \right)^2 + \frac{3}{4}} + \\ &+ \frac{2}{3} \cdot \frac{2}{\sqrt{3}} \operatorname{arctg} \frac{2}{\sqrt{3}} \left( t - \frac{1}{2} \right) \end{aligned}$$

Shunday qilib, berilgan integral quyidagicha hisoblanadi, ya'ni

$$\begin{aligned} \int \sqrt[3]{x(1-x^2)} dx &= -\frac{1}{2} \ln|1+t| + \frac{1}{4} \ln|t^2-t+1| - \frac{3}{2\sqrt{3}} \operatorname{arctg} \frac{2}{\sqrt{3}} \left( t - \frac{1}{2} \right) + \\ &+ \ln|1+t| - \frac{1}{2(1+t)} + \frac{1}{2} \ln|t^2-t+1| + \frac{2}{\sqrt{3}} \operatorname{arctg} \frac{2}{\sqrt{3}} \left( t - \frac{1}{2} \right) + \\ &+ \frac{3}{4\sqrt{3}} \frac{\left( t - \frac{1}{2} \right)}{\left( t - \frac{1}{2} \right)^2 + \frac{3}{4}} + \frac{2}{\sqrt{3}} \operatorname{arctg} \frac{2}{\sqrt{3}} \left( t - \frac{1}{2} \right) + C = \\ &= \frac{1}{2} \ln|1+t| + \frac{3}{4} \ln|t^2-t+1| - \frac{1}{2(1+t)} + \frac{5}{2\sqrt{3}} \operatorname{arctg} \frac{2}{\sqrt{3}} \left( t - \frac{1}{2} \right) + \\ &+ \frac{3}{4\sqrt{3}} \frac{\left( t - \frac{1}{2} \right)}{\left( t - \frac{1}{2} \right)^2 + \frac{3}{4}} + C, \end{aligned}$$

bunda  $t = \sqrt[3]{\frac{1}{x^2} - 1}$ .

**4.9- misol.**  $\int \frac{dx}{\sqrt[4]{1+x^4}}$  integralni hisoblang.

**Yechilishi.** Bu holda  $m=0, n=4, p=-\frac{1}{4}, \frac{m+1}{n}=p=\frac{1}{4}-\frac{1}{4}=0$  bo'lgani

uchun, 4.5 - bandning 3- holiga asosan,  $t = \sqrt[4]{x^{-4}+1} = \frac{\sqrt[4]{1+x^4}}{x}$  almashtirishni

bajarib, berilgan integralni hisoblaymiz:

$$\begin{aligned} \int \frac{dx}{\sqrt[4]{1+x^4}} &= [x = (t^4-1)^{\frac{1}{4}}, dx = -t^3(t^4-1)^{-\frac{3}{4}} dt] = \\ &= -\int \frac{t^2 dt}{t^4-1} = \frac{1}{4} \int \left( \frac{1}{t+1} - \frac{1}{t-1} \right) dt - \frac{1}{2} \int \frac{dt}{t^2+1} = \\ &= \frac{1}{4} \ln \left| \frac{t+1}{t-1} \right| - \frac{1}{2} \operatorname{arctg} t + C, \end{aligned}$$

bunda  $t = \sqrt[4]{x^4 + 1}$ .

### Mustaqil yechish uchun misollar

Quyidagi integrallarni hisoblang:

$$4.1. \int \frac{dx}{\sqrt{x} + \sqrt[4]{x}}.$$

$$4.3. \int \frac{dx}{1 + \sqrt{x+1}}.$$

$$4.5. \int \frac{dx}{\sqrt[3]{x} + 2\sqrt[4]{x} + \sqrt{x}}.$$

$$4.7. \int \frac{\sqrt{x+1}+1}{\sqrt{x+1}-1} dx.$$

$$4.9. \int \frac{\sqrt{x}-2}{x(\sqrt{x+1})} dx.$$

$$4.11. \int \sqrt{\frac{4x-5}{x+1}} dx.$$

$$4.13. \int \sqrt{\frac{x}{x+5}} \frac{dx}{x^2}.$$

## 5-§. Tarkibida trigonometrik funksiyalar qatnashgan ifodalarni integrallash

**5. 1.  $\int R(\sin x; \cos x)dx$  ko‘rinishdagi integralarni hisoblash.** Ushbu integral  $\int R(\sin x; \cos x)dx$  (5.1)

integralni qaraymiz.

1)  $R(\sin x; \cos x)$  -  $\sin x$  va  $\cos x$  larning rasional funksiyasi bo‘lsin. Bu holda (5.1) integralda  $t = \tg \frac{x}{2}$  ( $-\pi < x < \pi$ ) universal almashtirish olinib, uni hisoblash,  $t$  ga nisbatan rasional funksiyaning integralini hisoblashga keltiriladi. Haqiqatan ham, quyidagi

$$\sin x = \frac{2t}{1+t^2}, \quad \cos x = \frac{1-t^2}{1+t^2}, \quad dx = \frac{2dt}{1+t^2} \quad (5.2)$$

munosabatlarni e’tiborga olsak, (5.1) integral,

$$\int R(\sin x; \cos x)dx = \int R\left(\frac{2t}{1+t^2}, \frac{1-t^2}{1+t^2}\right) \frac{2}{1+t^2} dt$$

ko‘rinishga keladi.

2)  $R(-\sin x; \cos x) = -R(\sin x; \cos x)$  bo‘lsa, u holda,  $z = \cos x$ ,  $x \in (0; \pi)$  almashtirish bajarilsa, (5.1) integral ostidagi ifoda,  $z$  ning rasional funksiyasiga keltiriladi.

$$3) R(\sin x; -\cos x) = -R(\sin x; \cos x) \text{ bo'lsa, u holda, } z = \sin x, x \in \left(-\frac{\pi}{2}; \frac{\pi}{2}\right)$$

almashtirish bajarilsa, (5.1) integral ostidagi ifoda,  $z$  ning rasional funksiyasiga keltiriladi.

$$4) R(-\sin x; -\cos x) = R(\sin x; \cos x) \text{ bo'lsa, u holda, } z = \operatorname{tg} x, x \in \left(-\frac{\pi}{2}; \frac{\pi}{2}\right) \text{ yoki}$$

$z = \cos 2x$  almashtirishlardan biri bajarilsa, (5.1) integral ostidagi ifoda,  $z$  ning rasional funksiyasiga keltiriladi.

**5.1-misol.** Ushbu  $\int \frac{dx}{\sin x + 2 \cos x + 6}$  integralni hisoblang.

**Yechilishi.**  $t = \operatorname{tg} \frac{x}{2}$  universal almashtirish olib va (5.2) formulalarga asosan, uni  $t$  ga nisbatan rasional funksiyaning integralini hisoblashga keltiramiz:

$$\begin{aligned} \int \frac{dx}{\sin x + 2 \cos x + 6} &= 2 \int \frac{dt}{4t^2 + 2t + 8} = \frac{1}{2} \int \frac{dt}{\left(t + \frac{1}{4}\right)^2 + \frac{31}{16}} = \frac{2}{\sqrt{31}} \operatorname{arctg} \frac{4}{\sqrt{31}} \left(t + \frac{1}{4}\right) + C = \\ &= \frac{2}{\sqrt{31}} \operatorname{arctg} \frac{4}{\sqrt{31}} \left(\operatorname{tg} \frac{x}{2} + \frac{1}{4}\right) + C. \end{aligned}$$

**5.2-misol.** Ushbu  $\int \frac{dx}{\sin^4 x \cos x}$  integralni hisoblang.

**Yechilishi.** Agar  $\frac{1}{\sin^4 x \cos x}$  ifodada  $\cos x$  ni  $-\cos x$  ga almashtirsak, u holda, uning ishorasi, qarama - qarshi ishoraga o'zgaradi. Shuning uchun,  $t = \sin x, x \in \left(-\frac{\pi}{2}; \frac{\pi}{2}\right)$  almashtirishni olish qulay bo'ladi. Bunda,

$$x = \arcsin t, dx = \frac{1}{\sqrt{1-t^2}} dt, \cos x = \sqrt{1-\sin^2 x} = \sqrt{1-t^2},$$

va

$$\begin{aligned} \int \frac{dx}{\sin^4 x \cos x} &= \int \frac{1}{t^4 \sqrt{1-t^2}} \frac{1}{\sqrt{1-t^2}} dt = \int \frac{dt}{t^4 (1-t^2)} = \\ &= \int \frac{dt}{t^4} + \int \frac{dt}{t^2} + \int \frac{dt}{1-t^2} = -\frac{1}{3t^3} - \frac{1}{t} + \frac{1}{2} \ln \left| \frac{1+t}{1-t} \right| + C = -\frac{1}{3 \sin x^3} - \frac{1}{\sin x} + \frac{1}{2} \ln \left| \frac{1+\sin x}{1-\sin x} \right| + C. \end{aligned}$$

**5.3-misol.** Ushbu  $\int \frac{dx}{\sin^3 x \cos^2 x}$  integralni hisoblang.

**Yechilishi.** Integral ostidagi ifodada  $\sin x$  ni  $-\sin x$  ga almashtirgan-da, u o'z ishorasini teskarisiga almashtiradi. Bu holda 2) almashtirishni, ya'ni  $t = \cos x, x \in (0; \pi)$  deb olish qulay bo'ladi. Bunda,

$$x = \arccost, dx = -\frac{1}{\sqrt{1-t^2}} dt, \sin x = \sqrt{1-\cos^2 x} = \sqrt{1-t^2}, \sin^3 x = \sqrt{(1-\cos^2 x)^3} = \sqrt{(1-t^2)^3}$$

va

$$\int \frac{dx}{\sin^3 x \cos^3 x} = \int \frac{1}{\sqrt{(1-t^2)^3}} \frac{1}{t^2 \sqrt{1-t^2}} dt = \int \frac{1}{t^2(1-t^2)} dt = \int \frac{1}{t^2} dt + \int \frac{1}{1-t^2} dt =$$

$$= -\frac{1}{t} + \frac{1}{2} \ln \left| \frac{1+t}{1-t} \right| + C = -\frac{1}{\cos x} + \frac{1}{2} \ln \left| \frac{1+\cos x}{1-\cos x} \right| + C.$$

**5.4-misol.** Ushbu  $\int \frac{\sin x dx}{2\sin x + 3\cos x}$  integralni hisoblang.

**Yechilishi.** Integral ostidagi ifoda,  $\sin x$  va  $\cos x$  larni, mos ravishda,  $-\sin x$  va  $-\cos x$  larga almashtirganda, o‘z ishorasini o‘zgartirmaydi. Bu holda  $t = \operatorname{tg}x$ ,  $x \in \left(-\frac{\pi}{2}; \frac{\pi}{2}\right)$  almashtirish bajarilib, berilgan integral ostidagi ifoda  $t$  ning rasional funksiyasiga keltiriladi:  $x = \operatorname{arctgt}$ ,  $dx = \frac{dt}{1+t^2}$  va

$$\int \frac{\sin x dx}{2\sin x + 3\cos x} = \int \frac{\operatorname{tg}x dx}{2\operatorname{tg}x + 3} = \int \frac{tdt}{(2t+3)(1+t^2)}.$$

$\frac{t}{(2t+3)(1+t^2)}$  to‘g‘ri rasional kasrni, noma’lum koeffisientli (3.6) ko‘rinishdagi sodda kasrlar yig‘indisi shaklida tasvirlaymiz:

$$\frac{t}{(2t+3)(1+t^2)} = \frac{A}{2t+3} + \frac{Bt+C}{1+t^2}.$$

Undagi noma’lum koeffisientlarni topish uchun, yuqorida ko‘rsatilgan noma’lum koeffisientlar usulidan foydalanib, chiziqli algebraik tenglamalar sistemasini yechamiz:

$$t = A(1+t^2) + (Bt+C)(2t+3) \Rightarrow \begin{cases} t^2 & A+2B=0, \\ t & 3B+2C=1, \\ t^0 & A+3C=0, \end{cases} \Rightarrow A = -\frac{6}{13}, B = \frac{3}{13}, C = \frac{2}{13},$$

$$\int \frac{\sin x dx}{2\sin x + 3\cos x} = \int \left[ \frac{A}{2t+3} + \frac{Bt+C}{1+t^2} \right] dt = -\frac{6}{13} \int \frac{dt}{2t+3} + \frac{1}{13} \int \frac{3t+2}{1+t^2} dt =$$

$$= -\frac{3}{13} \ln|2t+3| + \frac{3}{26} \ln|1+t^2| + \frac{2}{13} \operatorname{arctgt} + C = -\frac{3}{13} \ln|2\sin x + 3\cos x| + \frac{2}{13} x + C.$$

**5.2.**  $\int \sin \alpha x \cos \beta x dx$ ,  $\int \sin \alpha x \sin \beta x dx$ ,  $\int \cos \alpha x \cos \beta x dx$  ko‘rinishidagi integrallarni hisoblash. Bu integrallar ostidagi ifodalarda, quyidagi

$$\sin \alpha x \cos \beta x = \frac{1}{2} [\sin(\alpha+\beta)x + \sin(\alpha-\beta)x], \quad (*)$$

$$\sin \alpha x \sin \beta x = \frac{1}{2} [\cos(\alpha-\beta)x - \cos(\alpha+\beta)x],$$

$$\cos \alpha x \cos \beta x = \frac{1}{2} [\cos(\alpha+\beta)x + \cos(\alpha-\beta)x]$$

formulalardan foydalanib, ularni integrallash mumkin.

**5.5-misol.** Ushbu  $\int \sin \alpha x \cos \beta x dx$  integralni hisoblang.

**Yechilishi.** (\*) formuladan foydalanib, integralni hisoblaymiz:

$$\int \sin 8x \cos 2x dx = \frac{1}{2} \int (\sin 10x + \sin 6x) dx = -\frac{1}{20} \cos 10x - \frac{1}{12} \cos 6x + C.$$

### 5.3. $\int \sin^n x \cos^m x dx$ ( $n, m \in \mathbb{Z}$ ) ko‘rinishdagi integrallarni hisoblash.

I.  $n, m$  - lar manfiy bo‘limgan juft sonlar bo‘lgan hol. Bu holda, darajani pasaytirish, ya’ni

$$\sin^2 x = \frac{1}{2}(1 - \cos 2x), \cos^2 x = \frac{1}{2}(1 + \cos 2x)$$

formulalar qo‘llaniladi.

II.  $n, m$  - lar natural sonlar bo‘lib, hech bo‘limganda ularning birortasi toq bo‘lgan hol. Bu holda, misol uchun,  $m$  toq bo‘lganda,  $\sin x = t$ ;  $n$  toq bo‘lganda esa,  $\cos x = t$  almashtirish olinadi va  $1 - \cos^2 x = \sin^2 x$  yoki  $1 - \sin^2 x = \cos^2 x$  formulalarning biridan foydalanishga to‘g‘ri keladi.

III.  $n, m$  - larning ikkalasi ham butun manfiy bo‘lib,  $|n|$  va  $|m|$  sonlar juft yoki toq bo‘lgan hol. Bu holda  $\tan x = t$  yoki  $\cot x = t$  almashtirish olinib,

$$1 + \tan^2 x = \frac{1}{\cos^2 x}, \quad 1 + \cot^2 x = \frac{1}{\sin^2 x}$$

formulalarning biridan foydalaniladi.

Ushbu

$$\int \frac{dx}{\sin^n x}, n > 0 \text{ ea } \int \frac{dx}{\cos^m x}, m > 0$$

integrallar ham, III holga keltirilib hisoblanadi.

Haqiqatan ham,

$$\int \frac{dx}{\sin^n x} = \frac{1}{2^{n-1}} \int \frac{d\left(\frac{x}{2}\right)}{\sin^n \frac{x}{2} \cdot \cos^n \frac{x}{2}} = \frac{1}{2^{n-1}} \int \frac{du}{\sin^n u \cos^n u} \Bigg|_{u=\frac{x}{2}},$$

$$\int \frac{dx}{\cos^m x} = \int \frac{d\left(x + \frac{\pi}{2}\right)}{\sin^m \left(x + \frac{\pi}{2}\right)} = \int \frac{du}{\sin^m u} \Bigg|_{u=x+\frac{\pi}{2}}.$$

IV.  $n, m$  - butun manfiy sonlar bo‘lib,  $|n|$  va  $|m|$  sonlarning biri toq bo‘lgan hol. U holda, agar  $|m|$  - toq bo‘lsa,  $\sin x = t$ ,  $|n|$  - toq bo‘lganda esa,  $\cos x = t$  almashtirish olish maqsadga muvofiq bo‘ladi. Ba’zi hollarda  $|n|$  va  $|m|$  larning darajalari katta bo‘lganda integral ostidagi funksiyaning suratida 1 ni  $\sin^2 x + \cos^2 x$  yig‘indi bilan almashtirish qulay bo‘ladi.

V.  $n$  - juft son,  $m$  - esa, butun manfiy son bo‘lgan hol. Bu holda  $\sin^2 x = 1 - \cos^2 x$  formuladan foydalanib, integral

$$\int \frac{dx}{\cos^\alpha x}, \alpha \in N$$

ko'rinishdagi integralga keltiriladi.

$m$ - just son,  $n$ - esa, butun manfiy bo'lganda  $\cos^2 x = 1 - \sin^2 x$  formuladan foydalanib, hisoblanishi kerak bo'lgan integral,

$$\int \frac{dx}{\sin^\alpha x}, \alpha \in N$$

ko'rinishdagi integralga keltiriladi.

VI.  $n$  - toq, son  $m$  - esa, butun manfiy son bo'lsa, bu holda  $\cos x = t$  almashtirish olib,  $\sin^2 x = 1 - \cos^2 x$  formuladan foydalanish kerak.

$m$  - toq,  $n$  - esa, butun manfiy son bo'lganda almashtirish olib,  $\cos^2 x = 1 - \sin^2 x$  formuladan foydalanish kerak.

Ba'zi hollarda, ya'ni  $|n|$  va  $|m|$  darajalar etarli katta bo'lgan integral ostidagi funksiyaning suratidagi 1 ni  $\sin^2 x + \cos^2 x$  ga almashtirish qulay bo'ladi.

**5.6 - misol.** Quyidagi integrallarni hisoblang:

$$1) \int \sin^4 x \cos^2 x dx; \quad 2) \int \sin^3 \cos^2 x dx; \quad 3) \int \frac{1}{\sin^2 x \cos^3 x} dx;$$

$$4) \int \frac{\sin^5 x}{\cos^2 x} dx; \quad 5) \int \frac{1}{\sin^5 x} dx; \quad 6) \int \frac{\cos^3 x}{\sin^2 x} dx; \quad 7) \int \frac{1}{\sin^2 x \cos^3 x} dx.$$

**Yechilishi.** 1) Bu erda  $n = 4, m = 2$  bo'lgani uchun, 1 - holga asosan,  $\sin^2 x = \frac{1}{2}(1 - \cos 2x)$  formuladan foydalanib, integralni hisoblaymiz:

$$\begin{aligned} \int \sin^4 x \cos^2 x dx &= \frac{1}{4} \int \sin^2 x \cdot \sin^2 2x dx = \frac{1}{4} \int \frac{1 - \cos 2x}{2} \cdot \frac{1 - \cos 4x}{2} dx = \\ &= \frac{1}{16} \int (1 - \cos 4x - \cos 2x + \cos 2x \cos 4x) dx = \\ &= \frac{1}{16} x - \frac{1}{64} \sin 4x - \frac{1}{32} \sin 2x + \frac{1}{16} \int (\cos 2x + \cos 6x) dx = \\ &= \frac{1}{16} x - \frac{1}{32} \sin 2x - \frac{1}{64} \sin 4x + \frac{1}{64} \sin 2x + \frac{1}{162} \sin 6x + C = \\ &= \frac{1}{16} x - \frac{1}{64} \sin 2x - \frac{1}{64} \sin 4x + \frac{1}{192} \sin 6x + C. \end{aligned}$$

2)  $\int \sin^3 x \cdot \cos^2 x dx$  integralni hisoblashda II holdagi almashtirishdan foydalanamiz: bunda  $n = 3$ , ya'ni u toq bo'lgani uchun,  $\cos x = t$  almashtirishni bajarib, quyidagiga ega bo'lamiz:

$$\begin{aligned} \int \sin^3 x \cdot \cos^2 x dx &= - \int \sin^2 x \cos^2 x d(\cos x) = - \int (1 - \cos^2 x) \cos^2 x d(\cos x) = \\ &= - \int (\cos^2 x - \cos^4 x) dx = - \frac{\cos^3 x}{3} + \frac{\cos^5 x}{5} + C. \end{aligned}$$

3) integralda  $n = -3$ ,  $m = -5$  bo'lib,  $|n|$  va  $|m|$  larning ikkalasi ham toq bo'lgani uchun, III holga asosan,  $\operatorname{ctgx} = t$  almashtirishni bajarib,  $1 + \operatorname{ctg}^2 x = \frac{1}{\sin^2 x}$  formuladan foydalangan holda hisoblaymiz:

$$\begin{aligned} \int \frac{1}{\sin^3 x \cos^5 x} dx &= \int \frac{dx}{\sin^2 x \cdot \frac{\cos^5 x}{\sin^5 x} \cdot \sin^6 x} = -\frac{d\operatorname{ctgx}}{\operatorname{ctg}^5 x \cdot \frac{1}{(1+\operatorname{ctg}^2 x)^3}} = \\ &= -\int \frac{(1+\operatorname{ctg}^2 x)^3 d\operatorname{ctgx}}{\operatorname{ctg}^5 x} = -\left. \frac{(1+u^2)^3 du}{u^5} \right|_{u=\operatorname{ctgx}} = \\ &= -\int \left( \frac{1}{u^5} + \frac{3}{u^3} + \frac{3}{u} + u \right) du \Big|_{u=\operatorname{ctgx}} = \left. \left( +\frac{u^{-4}}{4} + \frac{3}{2} u^{-2} - 3 \ln|u| - \frac{u^2}{2} + C \right) \right|_{u=\operatorname{ctgx}} = \\ &= \frac{1}{4} \cdot \frac{1}{\operatorname{ctg}^4 x} + \frac{3}{2} \cdot \frac{1}{\operatorname{ctg}^2 x} - 3 \ln|\operatorname{ctgx}| + \frac{\operatorname{ctg}^2 c}{2} + C. \end{aligned}$$

4) integralda  $n = 5$ ,  $m = -2$ , ya'ni  $n$  - toq,  $m$  - butun manfiy bo'lgani uchun, VI holga asosan,  $\cos x = t$  almashtirish olamiz va  $\sin^2 x = 1 - \cos^2 x$  formulani qo'llab, integralni hisoblaymiz:

$$\begin{aligned} \int \frac{\sin^5 x}{\cos^2 x} dx &= -\int \frac{\sin^4 x d\cos x}{\cos^2 x} = -\int \frac{(1-\cos^2 x)^2 d\cos x}{\cos^2 x} = \int \frac{1-2u^2+u^4}{u^2} du \Big|_{u=\cos x} = \\ &= \left. \left( \frac{1}{u} + 2u - \frac{u^3}{3} + C \right) \right|_{u=\cos x} = \frac{1}{\cos x} + 2 \cos x - \frac{\cos^3 x}{3} + C. \end{aligned}$$

5)  $\int \frac{dx}{\sin^5 x}$  integralni hisoblashda,  $\sin x = 2 \sin \frac{x}{2} \cos \frac{x}{2}$  formuladan foydalanim, uni quyidagi

$$\int \frac{dx}{\sin^5 x} = \frac{1}{2^4} \int \frac{d\left(\frac{x}{2}\right)}{\sin^5 \frac{x}{2} \cos^5 \frac{x}{2}} = \frac{1}{24} \int \frac{du}{\sin^5 u \cos^5 u} \Big|_{u=\frac{x}{2}}.$$

ko'rinishga keltiramiz. Keyingi integralda  $n = -5$ ,  $m = -5$  bo'lib,  $n$  va  $m$  larning ikkalasi ham toq bo'lgani uchun, III - holga asosan,  $\operatorname{ctgx} = t$  almashtirishni olish qulay bo'ladi:

$$\begin{aligned} \int \frac{dx}{\sin^5 x} &= \frac{1}{24} \int \frac{d\operatorname{ctgu}}{\operatorname{ctg}^5 u \cdot \sin^5 u} = \left[ 1 + \operatorname{ctg}^2 u = \frac{1}{\sin^2 u} \right] = \frac{1}{16} \int \frac{(1+z^2)^4}{z^5} dz \Big|_{z=\operatorname{ctgu}} = \\ &= \frac{1}{16} \int \frac{1+4z^2+6z^4+4z^6+z^8}{z^5} dz = \\ &= \left. \left( -\frac{1}{64} z^{-4} - \frac{1}{8} z^{-2} + \frac{3}{8} \ln|z| + \frac{1}{8} z^2 + \frac{1}{64} z^4 + C \right) \right|_{z=\operatorname{ctgu}} \end{aligned}$$

6) integralda  $n = -2$ ,  $m = 3$ , ya'ni  $n$  - butun manfiy,  $m$  - toq bo'lgani uchun, V holga asosan,  $\sin x = t$  almashtirish olamiz va  $\cos^2 x = 1 - \sin^2 x$  formuladan foydalanim, integralni hisoblaymiz:

$$\int \frac{\cos^3 x}{\sin^2 x} dx = \int \frac{(1 - \sin^2 x) d \sin x}{\sin^2 x} = \int \frac{(1 - u^2) du}{u^2} \Big|_{u=\sin x} =$$

$$= \int u^{-2} du - \int du = \left( -\frac{1}{u} - u + C \right) \Big|_{u=\sin x} = -\frac{1}{\sin x} - \sin x + C.$$

7) integralda  $n = -2$ ,  $m = -3$  ya'ni  $n$  va  $m$  manfiy sonlar bo'lib,  $|m|$  toq bo'lgani uchun, IV holga asosan,  $\sin x = u$  almashtirishni olib, integralni xisoblaymiz:

$$\int \frac{1}{\sin^2 x \cos^3 x} dx = \int \frac{\cos x}{\sin^2 x \cdot \cos^4 x} dx = \int \frac{d \sin x}{\sin^2 x (1 - \sin^2)^2} = \int \frac{du}{u^2 (1 - u^2)^2} \Big|_{u=\sin x} =$$

$$= \int \frac{du}{u^2 (1 - u)^2 (1 + u)^2} *$$

## II bob. ANIQ INTEGRAL

### 6-§. Aniq integralning ta’riflari

**6.1. Riman integrali.**  $f(x)$  funksiya  $[a,b]$  kesmada aniqlangan bo‘lsin.  $[a,b]$  kesmaning  $a = x_0 < x_1 < x_2 < \dots < x_{n-1} < x_n = b$  shartni qanoatatlantiradigan chekli sondagi  $\{x_k\}_{k=1}^n$  nuqtalar sistemasiga  $[a,b]$  kesmaning *bo‘linishi* deyiladi va u  $P = \{x_k\}_{k=1}^n$  kabi belgilanadi.  $x_k (k = \overline{1, n})$  nuqta  $P$  bo‘linishning bo‘luvchi nuqtasi  $[x_k, x_{k+1}]$  kesma esa, *qism oralig‘i* deyiladi. Agar  $[a,b]$  kesmaning ixtiyoriy  $P$  bo‘linishidagi qism oralig‘ining uzunliklari bir xil bo‘lsa, u holda, bunday bo‘linish,  $[a,b]$  kesmaning *regular bo‘linishi* deyiladi.  $d = d(P) = \max_{0 \leq k \leq n-1} \Delta x_k$  ( $\Delta x_k = x_{k+1} - x_k$ ),  $P$  bo‘linishning *diametri*, deb ataladi. Har bir  $[x_k, x_{k+1}]$  kesmadan ( $k = \overline{0, n-1}$ )  $\forall \xi_k$  nuqtani olamiz:  $x_k \leq \xi_k \leq x_{k+1}$ .

#### 6.1-ta’rif. Ushbu

$$\sigma_P(f) = \sigma_P(f, \{\xi_k\}) = \sum_{k=0}^{n-1} f(\xi_k) \Delta x_k \quad (6.1)$$

yig‘indiga,  $f(x)$  funksiyaning,  $P$  bo‘linishga va  $\xi_k$  nuqtani tanlashga mos kelgan, *integral yig‘indisi (Riman yig‘indisi)* deb ataladi.

**6.2-ta’rif.** Agar  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta = \delta(\varepsilon) > 0$  mavjud bo‘lib, diametri  $d(P) < \delta$  bo‘lgan  $[a,b]$  kesmaning har qanday  $P$  bo‘linishida, hamda  $\forall \xi_k (x_k \leq \xi_k \leq x_{k+1})$  nuqtani tanlashga bog‘liq bo‘limgan holda,

$$\left| J - \sum_{k=0}^{n-1} \sigma_P(f, \{\xi_k\}) \right| < \varepsilon \quad (6.2)$$

tengsizlik bajarilsa, u holda, shu  $J$  son, *integral yig‘indining limiti* deyiladi va u  $J = \lim_{d(P) \rightarrow 0} \sigma_P(f)$  kabi yoziladi.

**6.3- ta’rif.** Agar  $f(x)$  funksiya uchun, (6.1) integral yig‘indining  $d(P) \rightarrow 0$  da  $J$  limiti mavjud bo‘lsa, u holda,  $f(x)$  funksiya  $[a,b]$  kesmada *Riman ma’nosida integrallanuvchi* deyiladi.

Integral yig‘indining  $J$  limitiga  $f(x)$  funksiyadan  $[a,b]$  kesma bo‘yicha olingan *aniq integral (Riman ma’nosida)* deyiladi va u

$$\int_a^b f(x)dx = J \quad (6.3)$$

simvol orqali belgilanadi (6.3) da,  $f$ - integral ostidagi funksiya,  $a$  son-integralning quyi chegarasi,  $b$  son esa, integralning yuqori chegarasi, deb ataladi. Integral ostidagi  $x$  o'zgaruvchini boshqa o'zgaruvchiga almashtirish ham mumkin, ya'ni

$$\int_a^b f(x)dx = \int_a^b f(r)dt = \int_a^b f(z)dz$$

va h.k..

Ta'rif bo'yicha,  $\int_a^b f(x)dx = 0$ ,  $\int_a^b f(x)dx = -\int_b^a f(x)dx$  ( $a < b$  deb olamiz).

**6.1-misol.**  $f(x) = x$  funksiya ixtiyoriy  $[a, b]$  kesmada Riman ma'nosida integrallanuvchi ekanligini ko'rsating.

**Yechilishi.**  $[a, b]$  kesmaning  $\forall P = \{x_k\}_{k=1}^n$  bo'linishini olamiz. Natijada  $[a, b]$  kesma  $[x_0, x_1], [x_1, x_2], \dots, [x_{n-1}, x_n]$  bo'laklarga bo'linadi va  $\xi_i = \frac{x_i + x_{i-1}}{2}$  ( $\xi_k \in [x_{i-1}, x_i]$ ),  $i = \overline{1, n}$  deb belgilaymiz.  $P$  bo'linishga mos kelgan integral yig'indini tuzamiz:

$$\begin{aligned} \sigma_P(f) &= \sigma_P(f, \{\xi_i\}) = \sum_{i=1}^n f(\xi_i) \Delta x_i = \sum_{i=1}^n \frac{x_i + x_{i-1}}{2} (x_i - x_{i-1}) = \sum_{i=1}^n \frac{x_i^2 - x_{i-1}^2}{2} = \\ &= \frac{1}{2} [(x_1^2 - x_0^2) + (x_2^2 - x_1^2) + \dots + (x_n^2 - x_{n-1}^2)] = \frac{1}{2} (x_n^2 - x_0^2) = \frac{1}{2} (b^2 - a^2). \end{aligned}$$

$$\text{Bundan } \lim_{d(P) \rightarrow 0} \sigma_P(f) = \frac{b^2 - a^2}{2} = \int_a^b x dx.$$

Demak,  $f(x) = x$  funksiya ixtiyoriy  $[a, b]$  kesmada Riman ma'nosida integrallanuvchi ekan.

Aniq integralning ta'rifidan, har qanday Riman ma'nosida integrallanuvchi funksiya chegaralangan bo'lishiga ishonch hosil qilish qiyin emas, lekin har qanday chegaralangan funksiya har doim ham integrallanuvchi bo'lavermaydi.

**6.2 - misol.** Ushbu

$$D(x) = \begin{cases} 1, & x \text{ ratsional son bo'lganda,} \\ 0, & x \text{ irratsional son bo'lganda} \end{cases}$$

Dirixle funksiyasi  $[a, b] \subset \mathbb{R}$  ( $a < b$ ) kesmada Riman ma'nosida integrallanuvchi emasligini ko'rsating.

**Yechilishi.**  $[a, b]$  kesmaning  $\forall P$  bo'linishini olib, quyidagi

$$\sigma_P(D; \{\xi_k\}) = \sum_{k=1}^n D(\xi_k) \cdot \Delta x_k,$$

$$\sigma_P(D; \{\eta_k\}) = \sum_{k=1}^n D(\eta_k) \Delta x_k$$

yig'indilarni tuzamiz.  $\xi_k \in [x_{k-1}, x_k]$  nuqta sifatida  $[x_{k-1}, x_k]$  kesmadagi ixtiyoriy rasional nuqtani,  $\eta_k$  sifatida esa ( $\eta_k \in [x_{k-1}, x_k]$ ), shu kesmadagi ixtiyoriy irrasional nuqtani olamiz. U holda,  $D(\xi_k) = 1$ ,  $D(\eta_k) = 0$  bo'ladi. Shuning uchun,

$$\sigma_P(D; \{\xi_k\}) = \sum_{k=1}^n \Delta x_k = b - a, \quad \sigma_P(D; \{\eta_k\}) = 0$$

Demak,  $b - a \neq 0$  uchun Dirixle funksiyasining integral yig'indisi, 6.2-ta'rifga binoan, limitga ega emas. Shuning uchun, Dirixle funksiyasi  $[a, b]$  kesmada integrallanuvchi emas.

### 6.3-misol. Ushbu

$$f(x) = \begin{cases} x, & x \text{ ratsional son bo'lganda,} \\ -x, & x \text{ irratsional son bo'lganda} \end{cases}$$

funksiyaning  $[a, b] \subset R$  ( $a < b$ ) kesmada Riman ma'nosida integrallanuvchi emasligini ko'rsating.

**Yechilishi.**  $P - J = [a, b]$  kesmaning ixtiyoriy bo'linishi bo'lsin. Unda  $J = [a, b]$  kesma  $J_1, J_2, \dots, J_n$  kesmalarga bo'linadi.  $\xi_k \in [x_{k-1}, x_k] = J_k$  nuqta sifatida,  $[x_{k-1}, x_k]$  kesmadagi ixtiyoriy rasional nuqtani,  $\eta_k$  ( $\eta_k \in [x_{k-1}, x_k]$ ) sifatida esa, shu kesmadagi ixtiyoriy irrasional nuqtani olamiz. U holda,

$$\sigma_P(f; \{\xi_k\}) = \sum_{k=1}^n f(\xi_k) \cdot \Delta x_k = \sum_{k=1}^n \xi_k \cdot \Delta x_k,$$

$$\sigma_P(f; \{\eta_k\}) = \sum_{k=1}^n f(\eta_k) \Delta x_k = \sum_{k=1}^n (-\eta_k) \cdot \Delta x_k$$

yig'indilarni tuzamiz. Bunda  $\sigma_P(f; \{\xi_k\})$  yig'indi  $f_1(x) = x$  funksiya uchun integral yig'indi bo'ladi va u 6.1-misolga asosan,

$$\lim_{d(P) \rightarrow 0} \sigma_P(f; \{\xi_k\}) = \frac{b^2 - a^2}{2} = \int_a^b x dx.$$

bo'ladi.  $\sigma_P(f; \{\eta_k\})$  yig'indi esa,  $f_2(x) = -x$  funksiya uchun integral yig'indi bo'lib,

$$\lim_{d(P) \rightarrow 0} \sigma_P(f; \{\eta_k\}) = -\frac{b^2 - a^2}{2} = -\int_a^b x dx.$$

bo'ladi. Shunday qilib, berilgan integral yig'indi yagona limitga ega emas.

Demak, berilgan funksiya  $[a,b]$  kesmada Riman ma'nosida integrallanuvchi emas.

**6.4-misol.**  $[a,b]$  kesmada chegaralanmagan funksiyaning Riman ma'nosida integrallanuvchi emasligini isbotlang.

**Yechilishi.**  $f(x)$  funksiya  $[a,b]$  kesmada chegaralanmagan bo'lsin.  $[a,b]$  kesmani chekli  $P = \{x_k\}_{k=1}^n$  nuqtalar sistemasi yordamida chekli sondagi  $[x_{k-1}, x_k]$  kesmalarga bo'lamiciz, u holda,  $f(x)$  funksiya shu kesmalarning, hech bo'limganda, birida chegaralanmagan bo'ladi. Umumiylikni buzmaslik uchun,  $f(x)$  funksiya  $[x_0, x_1]$  kesmada chegaralanmagan bo'lsin, deb faraz qilamiz. Qolgan  $[x_1, x_2], [x_2, x_3], \dots, [x_{n-1}, x_n]$  kesmalardan  $\forall \xi_2, \xi_3, \dots, \xi_n$  nuqtalarni olib, ularni belgilaymiz va ushbu

$$\sigma_p(f) = \sigma_p(f, \{\xi_k\}) = f(\xi_2)\Delta x_2 + \dots + f(\xi_n)\Delta x_n$$

yig'indini tuzamiz. Endi  $f(x)$  funksiyani  $[x_0, x_1]$  kesmada qaraymiz.  $f(x)$  funksiya  $[x_0, x_1]$  kesmada chegaralanmaganligi uchun, ixtiyoriy oldindan berilgan  $M > 0$  son uchun, bu kesmadan shunday  $\xi_i$  nuqta topiladiki, bu nuqtada  $|f(\xi_i)| \geq \frac{(\bar{\sigma}_p + M)}{\Delta x_i}$  bo'ladi. Bundan,  $|f(\xi_i)| \cdot \Delta x_i \geq |\bar{\sigma}_p| + M$  bo'ladi.

Shuning uchun,  $\forall P = \{x_k\}_{k=1}^n$  bo'linishga mos kelgan integral yig'indi,

$$|\sigma_p(f, \{\xi_k\})| = \left| \sum_{k=1}^n f(\xi_k) \Delta x_k \right| = |f(\xi_1) \Delta x_1 + \bar{\sigma}_p(f)| \geq |f(\xi_1)| \Delta x_1 - |\bar{\sigma}_p(f)| \geq M$$

tengsizlikni qanoatlantiradi.

$\lim_{n \rightarrow \infty} M_n = +\infty$  bo'lgan  $\{M_n\}$  sonlar ketma-ketligini, hamda  $[a,b]$  kesmaning diametrleri  $d_n(p) \rightarrow 0$  bo'lgan  $P_1, P_2, \dots, P_n \dots$  bo'linishlari ketma-ketligini qaraylik. Bu bo'linishlarga mos va  $|\sigma_p''(f)| \geq M_n$  shartni qanoatlantiruvchi  $\{\sigma_p''(f)\}$  integral yig'indilar ketma-ketligini ham qaraymiz. Bu integral yig'indilar ketma-ketligi uzoqlashuvchi bo'ladi, ya'ni  $f(x)$  funksiya  $[a,b]$  kesmada integrallanuvchi bo'lmaydi. Shunday qilib, yuqoridagi ta'rif va 6.2 - 6.4- misollardan, quyidagi xulosani chiqarish mumkin.

Agar  $f(x)$  funksiya  $[a,b]$ da integrallanuvchi bo'lsa, u holda, u shu kesmada chegaralangan bo'ladi. Bu tasdiqning teskarisi o'rini emas (6.2- misolga qarang), ya'ni  $f(x)$  funksiyaning integrallanuvchi bo'lishi uchun, uning chegaralanganligi zaruriy shart bo'lib, lekin etarli shart bo'la olmas ekan.

Aniq integralni, ta'rif bo'yicha, ya'ni integralni integral yig'indining limiti sifatida qarab, hisoblashga doir misollar keltiramiz:

**6.5 -misol.** Ushbu  $\int_0^{\frac{\pi}{2}} \cos x dx$  integralni ta'rif bo'yicha hisoblang.

**Yechilishi.**  $[0; \frac{\pi}{2}]$  kesmaning regular  $P$  bo'linishini, ya'ni  $P = \left\{ x_0 = 0, x_1 = \frac{\pi}{2n}, \dots, x_n = \frac{\pi}{2} \right\}$  bo'linishni qaraymiz. U holda,  $\Delta x_k = x_{k+1} - x_k = \frac{\pi}{2n}$  bo'ladи.  $\xi_k$  nuqta sifatida,  $[x_k, x_{k+1}]$  kesmaning o'ng chetki nuqtasini olamiz, ya'ni  $\xi_k = x_{k+1}$ . Funksiyaning  $\xi_k$  nuqtalardagi qiymatlarini hisoblaymiz:

$$f(\xi_0) = \cos \xi_0 = \cos \frac{\pi}{2n}, \dots, f(\xi_k) = \cos \xi_k = \frac{(k+1)\pi}{2n}, \dots, f(\xi_{n-1}) = \cos \xi_{n-1} = 0$$

Endi  $\cos x$  funksiyaning  $[0; \frac{\pi}{2}]$  kesma uchun integral yig'indisini tuzib, uning  $n \rightarrow \infty$  da limitini hisoblaymiz:

$$\begin{aligned} \sigma_P(f) &= \sigma_P(\cos x) = \sum_{k=0}^{n-1} f(\xi_k) \Delta x_k = \sum_{k=0}^{n-1} \cos \xi_k \cdot \frac{\pi}{2n} = \\ &= \frac{\pi}{2n} [\cos \frac{\pi}{2n} + \cos \frac{2\pi}{2n} + \dots + \cos \frac{(n-1)\pi}{4n}] = \frac{\pi \cdot \sin \frac{\pi}{4} \cdot \sin \frac{(n-1)\pi}{4n}}{2n \cdot \sin \frac{\pi}{4n}}, \end{aligned}$$

$$\lim_{n \rightarrow \infty} \sigma_P(f) = \lim_{n \rightarrow \infty} \frac{\pi \cdot \sin \frac{\pi}{4} \cdot \sin \frac{(n-1)\pi}{4n}}{2n \cdot \sin \frac{\pi}{4n}},$$

Bunda,  $\lim_{n \rightarrow \infty} 2n \cdot \sin \frac{\pi}{4n} = \frac{\pi}{2}$ ,  $\sin x$  ning uzluksizligini e'tiborga olsak, u holda,

$$\int_0^{\frac{\pi}{2}} \cos x dx = \lim_{n \rightarrow \infty} \sigma_P(\cos x) = \frac{\pi \cdot \sin^2 \frac{\pi}{4}}{\frac{\pi}{2}} = 1.$$

**6.6. -misol.** Ushbu

$$\int_a^b x^m dx \quad (0 < a < b), \quad m \neq -1$$

integralni ta'rif bo'yicha hisoblang.

**Yechilishi.**  $[a, b]$  kesmaning regular bo'limgan bo'linishini, ya'ni  $P = \left\{ x_0 = a < x_1 < x_2 < \dots < x_n = b \right.$  бунда  $x_k = aq^k$ ,  $q = \sqrt[n]{\frac{b}{a}}$   $\left. \right\}$  bo'linishni qaraymiz.

$\xi_k$  nuqta sifatida,  $[x_k, x_{k+1}]$  kesmaning chap chetki nuqtasini olamiz, ya'ni  $\xi_k = x_k$ . U holda, integral yig'indining ko'rinishi quyidagicha bo'ladi:

$$\begin{aligned}\sigma_P(f) &= \sigma_P(x^m) = \sum_{k=0}^{n-1} f(\xi_k) \Delta x_k = \sum_{k=0}^{n-1} \xi_k^m (x_{k+1} - x_k) = \\ &= \sum_{k=0}^{n-1} (aq^k)^m a(q^{k+1} - q^k) = a^{m+1}(q-1) \sum_{k=0}^{n-1} q^{k(m+1)}\end{aligned}$$

Bundan, geometrik progressiya hadlari yig'indisi formulasini hisobga olgan holda,

$$\sigma_P(x^m) = \frac{a^{m+1}(q-1)\left(\frac{b}{a}\right)^{m+1} - 1}{q^{m+1} - 1} = \frac{(b^{m+1} - a^{m+1})(q-1)}{q^{m+1} - 1}$$

munosabatni hosil qilamiz, bunda  $n \rightarrow \infty$  da  $q = \sqrt[n]{\frac{b}{a}} \rightarrow 1$  va  $\lim_{\lambda \rightarrow 0} \frac{(1+\lambda)^n - 1}{\lambda} = \mu$  formulani e'tiborga olsak,

$$\int_a^b \frac{dx}{x^m} = \lim_{n \rightarrow \infty} \sigma_n(x^m) = (b^{m+1} - a^{m+1}) \lim_{q \rightarrow 1} \frac{q-1}{q^{m+1} - 1} = \frac{b^{m+1} - a^{m+1}}{m+1}.$$

$m = -1$  bo'lgan holda,

$$\sigma_P(x^{-1}) = n(q-1) = n\left(\sqrt[n]{\frac{b}{a}} - 1\right)$$

bo'ladi. Buyerde  $\lim_{\lambda \rightarrow 0} \frac{a^\lambda - 1}{\lambda} = \ln a$  formulani e'tiborga olsak, u holda,

$$\int_a^b \frac{dx}{x} = \lim_{n \rightarrow \infty} \sigma_n(t) = \lim_{n \rightarrow \infty} \sigma_n\left(\frac{1}{x}\right) = \lim_{n \rightarrow \infty} n\left(\sqrt[n]{\frac{b}{a}} - 1\right) = \ln b - \ln a$$

ekanligi kelib chiqadi.

**6.7-misol.** Ushbu  $\int_0^1 e^x dx$  aniq integralni ta'rif bo'yicha hisoblang.

**Yechilishi.**  $f(x) = e^x$  funksiya  $[0,1]$  kesmada aniqlangan.  $[0,1]$  kesmaning

$P = \{x_0 = 0 < x_1 = \frac{1}{n} < \dots < x_k = \frac{k}{n} < \dots < x_n = \frac{n}{n} = 1\}$  regular bo'linishini qaraymiz.

Ravshanki,  $[x_k, x_{k+1}]$  kesmaning uzunligi,  $\Delta x_k = \frac{1}{n}$ .  $\xi_k$  nuqta sifatida, kesmaning chap chetki nuqtasini olamiz, ya'ni  $\xi_k = x_k = \frac{k}{n}$  ( $k = 0, 1, \dots, n-1$ ).

Endi shu  $P$  bo'linishga mos kelgan integral yig'indini tuzamiz:

$$\sigma_P(e^x) = \sum_{k=0}^{n-1} e^{\frac{k}{n}} = \left(1 + e^{\frac{1}{n}} + e^{\frac{2}{n}} + \dots + e^{\frac{n-1}{n}}\right) \cdot \frac{1}{n}.$$

$1 + e^{\frac{1}{n}} + \dots + e^{\frac{n-1}{n}}$  yig‘indi, birinchi hadi  $b_0 = 1$ , maxraji  $q = e^{\frac{1}{n}}$  bo‘lgan geometrik progressiya  $n$  ta hadining yig‘indisidan iborat bo‘lgani uchun,

$$1 + e^{\frac{1}{n}} + \dots + e^{\frac{n-1}{n}} = \frac{e - 1}{\frac{1}{e^n} - 1}.$$

Shunday qilib,

$$\sigma_p(e^x) = \sigma_p\left(e^x, \left\{\frac{k}{n}\right\}\right) = \frac{1}{n} \cdot \frac{e - 1}{\frac{1}{e^n} - 1}$$

Bundan,

$$\lim_{n \rightarrow \infty} \sigma_p\left(e^x, \left\{\frac{k}{n}\right\}\right) = (e - 1) \lim_{n \rightarrow \infty} \frac{\frac{1}{n}}{\frac{1}{e^n} - 1} = e - 1$$

Demak,

$$J = \int_0^1 e^x dx = e - 1.$$

**6.2. Darbu yig‘indilari.** Biz bundan keyin, hamma vaqt chegaralangan funksiyalarni qaraymiz, chunki chegaralanmagan funksiya Riman ma’nosida integrallanuvchi emas (6.4 – misolga qarang).

$f(x)$  funksiya  $[a, b]$  kesmada chegaralangan bo‘lsin.  $[a, b]$  kesmaning ixtiyoriy  $P = \{a = x_0 < x_1 < x_2 < \dots < x_n = b\}$  bo‘linishini qaraymiz.  $f(x)$  funksiya  $[a, b]$  kesmada chegaralangan bo‘lgani uchun, u  $\forall [x_{k-1}, x_k]$  kesmada ham chegaralangan bo‘ladi.  $f(x)$  funksiyaning  $[x_{k-1}, x_k]$  kesmadagi  $m_k$  aniq quyisi,  $M_k$  aniq yuqori chegaralari, ya’ni  $m_k = \inf_{x_{k-1} \leq x \leq x_k} f(x)$ ,  $M_k = \sup_{x_{k-1} \leq x \leq x_k} f(x)$  mavjud bo‘ladi va  $\forall \xi_k \in [x_{k-1}, x_k]$  uchun  $m_k \leq f(\xi_k) \leq M_k$  tengsizliklar o‘rinli.

#### 6.4-ta’rif. Ushbu

$$S_P(f) = M_1 \Delta x_1 + M_2 \Delta x_2 + \dots + M_n \Delta x_n = \sum_{k=1}^n M_k \Delta x_k \quad (6.3)$$

$$s_P(f) = m_1 \Delta x_1 + m_2 \Delta x_2 + \dots + m_n \Delta x_n = \sum_{k=1}^n m_k \Delta x_k \quad (6.4)$$

yig‘indilar, mos ravishda,  $f(x)$  funksiyaning, berilgan  $P = \{x_k\}_{k=1}^n$  bo‘linishga mos kelgan, *quyi va yuqori Darbu yig‘indilari* deyiladi.

Darbu yig‘indilari quyidagi xossalarga ega:

**1-xossa.** Darbuning har qanday (6.4) quyi yig‘indisi, Darbuning (6.3) yuqori yig‘indisidan oshmaydi:  $s_p(f) \leq S_p(f)$ .

**2-xossa.**  $\forall \xi_k$  ( $x_k \leq \xi_k \leq x_{k+1}$ ) nuqtani tanlashga bog'liq bo'limgan holda, Darbu yig'indilari uchun,  $s_p(f) \leq \sigma_p(f) \leq S_p(f)$  tengsizliklar o'rini.

**3-xossa.** Har qanday  $P$  bo'linish uchun,

$$s_p(f) = \sup_{\xi_k \in [x_{k-1}, x_k]} \sigma_p(f; \{\xi_k\}), \quad s_p(f) = \inf_{\eta_k \in [x_{k-1}, x_k]} \sigma_p(f; \{\eta_k\})$$

munosabatlar o'rini.

**4-xossa.** Darbuning (6.4) quyi yig'indilari to'plami yuqorida chegaralangan, (6.3) yuqori yig'indilari to'plami esa, quyidan chegaralangan.

**5-xossa.** Agar  $P - [a, b]$  kesmaning ixtiyoriy bo'linishi bo'lib,  $P$  esa,  $P$  bo'linishning nuqtalariga chekli sondagi yangi bo'linish nuqtalari qo'shishdan hosil bo'lgan bo'linish bo'lsa, u holda,

$$s_p(f) \leq s_{p'}(f), \quad s_{p'}(f) \leq S_p(f) \quad (6.6)$$

munosabatlar o'rini bo'ldi.

**6.4-ta'rif.**  $\{s_p(f)\}$  to'plamning aniq yuqori chegarasi,  $f(x)$  funksiyadan  $[a, b]$  kesma bo'yicha olingan Darbuning *quyi integrali* deb ataladi va u,

$$\sup_P \{s_p(f)\} = \underline{J} = \int_a^b f(x) dx$$

kabi belgilanadi.

**6.4-ta'rif.**  $\{s_p(f)\}$  to'plamning aniq quyi chegarasi,  $f(x)$  funksiyadan  $[a, b]$  kesma bo'yicha olingan Darbuning *yuqori integrali* deb ataladi va u,

$$\inf_P \{s_p(f)\} = \bar{J} = \int_a^b f(x) dx$$

kabi belgilanadi.

**6-xossa.** Darbuning quyi integrali, uning yuqori integralidan katta bo'la olmaydi, ya'ni

$$\underline{J} \leq \bar{J}.$$

**6.5-ta'rif.** Agar  $f(x)$  funksiyaning  $[a, b]$  kesmadagi quyi va yuqori Darbu integrallari bir - biriga teng bo'lsa, u holda  $f(x)$  funksiya  $[a, b]$  kesmada *Darbu ma'nosida integrallanuvchi* deyiladi va ularning umumiy qiymati

$$\underline{J} = \bar{J} = J,$$

$f(x)$  funksiyaning  $[a, b]$  kesmadagi aniq integrali (Darbu ma'nosida) deyiladi va u

$$J = \int_a^b f(x) dx$$

kabi belgilanadi.

Agar  $J \neq \bar{J}$  bo'lsa, u holda,  $f(x)$  funksiya  $[a, b]$  kesmada integrallanuvchi emas deyiladi.

6.3 -va 6.5 -ta'riflar, o'zaro teng kuchli ta'riflardir.

**6.8-misol.**  $f(x) = x^3$  funksiya uchun,  $[-2; 3]$  kesmada, ixtiyoriy regular  $P$  bo'linishga mos kelgan, quyi va yuqori Darbu yig'indilari tuzilsin.

**Yechilishi.**  $[-2; 3]$  kesmaning ushbu

$P = \{x_0 = -2 < x_1 = -2 + \frac{5}{n} < x_2 = -2 + \frac{10}{n} < \dots < x_k = -2 + \frac{5k}{n} < \dots < x_n = 3\}$  regulyar bo'linishini qaraymiz, bunda  $[x_{k-1}, x_k]$  kesmaning uzunligi  $\Delta x_k = \frac{5}{n}$  ( $k = 1, n$ ),  $x_k = -2 + \frac{5k}{n}$ . (6.3) va (6.4) formulalarga asosan, Darbu yig'indilarini tuzamiz.

Berilgan funksiya  $[-2; 3]$  kesmada o'suvchi bo'lganligi uchun, u o'zining aniq quyi va aniq yuqori chegarasiga, mos ravishda, kesmaning chap va o'ng chetki nuqtalarida erishadi, ya'ni

$$m_k = \left( -2 + \frac{5}{n}(k-1) \right)^3, M_k = \left( -2 + \frac{5}{n}k \right)^3.$$

Shunday qilib,

$$s_P(x^3) = \sum_{k=0}^{n-1} \left( -2 + \frac{5}{n}k \right)^3 \cdot \frac{5}{n}, \quad S_P(x^3) = \sum_{k=1}^n \left( -2 + \frac{5}{n}k \right)^3 \cdot \frac{5}{n}$$

Endi, Darbu yig'indilarini hisoblaymiz:

$$\begin{aligned} S_P(x^3) &= \frac{5}{n} \sum_{k=1}^n \left( -2 + \frac{5}{n}k \right)^3 = \frac{5}{n} \sum_{k=1}^n \left[ \frac{125}{n^3} k^3 - 3 \cdot \frac{25}{n^2} \cdot k^2 \cdot 2 + \right. \\ &\quad \left. + 3 \cdot \frac{5}{n} k \cdot 4 - 8 \right] = \frac{625}{n^4} \sum_{k=1}^n k^3 - \frac{150 \cdot 5}{n^3} \sum_{k=1}^n k^2 + \frac{300}{n^2} \sum_{k=1}^n k - 40. \end{aligned}$$

Ma'lumki,

$$\sum_{k=1}^n k = \frac{n(n+1)}{2}, \quad \sum_{k=1}^n k^2 = \frac{n(n+1)(2n+1)}{6}, \quad \sum_{k=1}^n k^3 = \frac{n^2(n+1)^2}{4}$$

Bu formulalarni e'tiborga olib, oxirgi tenglikdan,

$$S_P(x^3) = 16 \frac{1}{4} + \frac{175}{2n} + \frac{125}{n^2}.$$

bo'lishini olamiz.

Xuddi shunday,

$$s_P(x^3) = 16 \frac{1}{4} - \frac{175}{2n} + \frac{125}{n^2}$$

ifoda topiladi.

**6.9-misol.**  $f(x) = 2x$ ,  $x \in [0, 1]$ ,  $P = \left\{0, \frac{1}{8}, \frac{1}{4}, \frac{1}{2}, \frac{6}{4}, 1\right\}$  va  $\xi_1 = \frac{1}{16}, \xi_2 = \frac{3}{16}, \xi_3 = \frac{3}{8}$ ,

$$i) s_P(f) = \frac{25}{32} < S^*(f) = \frac{15}{16} < S_P(f) = \frac{39}{32}, \text{ ya'ni } \frac{25}{32} < \frac{15}{16} < \frac{39}{32}.$$

**6.10-misol.**  $f(x) = 2x$  funksiya uchun,  $[0;1]$  kesmada,  $P_1 = \left\{0, \frac{1}{4}, \frac{1}{2}, 1\right\}$

va  $P_2 = \left\{0, \frac{1}{8}, \frac{1}{4}, \frac{1}{2}, \frac{2}{3}, 1\right\}$  bo'linishlarga mos kelgan, Darbu yig'indilarini tuzing va ularni solishtiring.

**Yechilishi.** 1)  $P_1$  bo'linish,  $[0;1]$  kesmani,  $[0, \frac{1}{4}], [\frac{1}{4}, \frac{1}{2}], [\frac{1}{2}, 1]$  ( $x_0 = 0; x_4 = 1$ ) qism kesmalarga bo'ladi.  $f(x) = 2x$  funksiya,  $[0;1]$  kesmada uzliksiz va o'suvchi bo'lgani uchun, kesmalarning chap chetki nuqtalarida  $m_i$  ( $i=1,2,3$ ) minimal qiymatlariga, o'ng chetki nuqtalarida  $M_i$  ( $i=1,2,3$ ) maksimal qiymatlariga erishadi, ya'ni

$$M_1 = f\left(\frac{1}{4}\right) = 2 \cdot \frac{1}{4} = \frac{1}{2}; M_2 = f\left(\frac{1}{2}\right) = 2 \cdot \frac{1}{2} = 1; M_3 = f(1) = 2 \cdot 1 = 2;$$

$$m_1 = f(0) = 2 \cdot 0 = 0; m_2 = f\left(\frac{1}{4}\right) = 2 \cdot \frac{1}{4} = \frac{1}{2}; m_3 = f\left(\frac{1}{2}\right) = 2 \cdot \frac{1}{2} = 1.$$

$\Delta x_i$  ( $i=1;2;3$ ) – qism kesmalarning uzunliklarini topamiz:

$$\Delta x_1 = x_1 - x_0 = \frac{1}{4} - 0 = \frac{1}{4}; \Delta x_2 = \frac{1}{2} - \frac{1}{4} = \frac{1}{4}; \Delta x_3 = 1 - \frac{1}{2} = \frac{1}{2}.$$

U holda, (6.3) va (6.4) formulalarga asosan,

$$S_{P_1}(f) = M_1 \Delta x_1 + M_2 \Delta x_2 + M_3 \Delta x_3 = \frac{1}{2} \cdot \frac{1}{4} + 1 \cdot \frac{1}{4} + 2 \cdot \frac{1}{2} = \frac{11}{8},$$

$$s_{P_1}(f) = m_1 \Delta x_1 + m_2 \Delta x_2 + m_3 \Delta x_3 = 0 \cdot \frac{1}{4} + \frac{1}{2} \cdot \frac{1}{4} + 1 \cdot \frac{1}{2} = \frac{5}{8}.$$

2)  $P_2 = \left\{0, \frac{1}{8}, \frac{1}{4}, \frac{1}{2}, \frac{2}{3}, 1\right\}$  bo'linish,  $[0;1]$  kesmani,

$$[0; \frac{1}{8}], [\frac{1}{8}; \frac{1}{4}], [\frac{1}{4}; \frac{1}{2}], [\frac{1}{2}; \frac{2}{3}], [\frac{2}{3}; 1]$$

qism kesmalarga bo‘ladi.  $f(x)=2x$  funksiya, kesmalarning o‘ng chetki nuqtalarida,  $M_i (i=1,5)$  maksimal qiymatlarni, chap chetki nuqtalarida esa,  $m_i (i=1,5)$  minimal qiymatlarni qabul qiladi, ya’ni

$$M_1 = f\left(\frac{1}{8}\right) = \frac{1}{4}; \quad M_2 = f\left(\frac{1}{4}\right) = \frac{1}{2}; \quad M_3 = f\left(\frac{1}{2}\right) = 1; \quad M_4 = f\left(\frac{2}{3}\right) = \frac{4}{3}; \quad M_5 = f(1) = 2;$$

$$m_1 = f(0) = 0; \quad m_2 = f\left(\frac{1}{8}\right) = \frac{1}{4}; \quad m_3 = f\left(\frac{1}{4}\right) = \frac{1}{2}; \quad m_4 = f\left(\frac{1}{2}\right) = 1; \quad m_5 = f\left(\frac{2}{3}\right) = \frac{4}{3}$$

$\Delta x_i (i=1,5)$  qism kesmalarning uzunliklari:

$$\Delta x_1 = \frac{1}{8}; \quad \Delta x_2 = \frac{1}{8}; \quad \Delta x_3 = \frac{1}{4}; \quad \Delta x_4 = \frac{1}{6}; \quad \Delta x_5 = \frac{1}{3}.$$

U holda, (6.3) va (6.4) formulalarga asosan,

$$S_{P_1}(f) = M_1 \Delta x_1 + M_2 \Delta x_2 + M_3 \Delta x_3 + M_4 \Delta x_4 + M_5 \Delta x_5 = \frac{1}{4} \cdot \frac{1}{8} + \frac{1}{2} \cdot \frac{1}{8} +$$

$$+ 1 \cdot \frac{1}{4} + \frac{4}{3} \cdot \frac{1}{6} + 2 \cdot \frac{1}{3} = \frac{355}{288},$$

$$S_{P_2} = m_1 \Delta x_1 + m_2 \Delta x_2 + m_3 \Delta x_3 + m_4 \Delta x_4 + m_5 \Delta x_5 = 0 \cdot \frac{1}{4} + \frac{1}{8} + \frac{1}{2} \cdot \frac{1}{4} + 1 \cdot \frac{1}{6} + \frac{4}{3} \cdot \frac{1}{3} = \frac{221}{288}$$

Endi, Darbuning,  $P_1$  va  $P_2$  bo‘linishlarga mos kelgan, quyi va yuqori yig‘indilarini solishtiramiz:

$$S_{P_1}(f) = \frac{11}{8} = 1,375, \quad S_{P_2}(f) = \frac{5}{8} = 0,625,$$

$$S_{P_2}(f) = \frac{355}{288} = 1,233, \quad S_{P_2}(f) = \frac{221}{288} = 0,767.$$

Demak,  $S_{P_1}(f) < S_{P_2}(f) (S_{P_1}(f) > S_{P_2}(f))$ , ya’ni  $P_1$  bo‘linishga yangi nuqtalar qo‘shilganda,  $S_{P_2}(f)$  quyi yig‘indining kamaymasligini,  $S_{P_1}(f)$  yuqori yig‘indining ortmasligini ko‘ramiz.

**6.11-misol.**  $f(x)=1-x$  funksiya uchun,  $[0; 2]$  kesmada,  $P_1 = \{0, \frac{1}{3}, \frac{3}{4}, 1, 2\}$  va  $P_2 = \{0, \frac{1}{6}, \frac{1}{3}, \frac{2}{3}, \frac{3}{4}, 1, \frac{3}{2}, 2\}$  bo‘linishlarga mos kelgan, Darbu yig‘indilarini tuzing va ularni solishtiring.

**Yechilishi.** 1)  $P_1$  bo‘linish,  $[0; 2]$  kesmani,  $[0; \frac{1}{3}], [\frac{1}{3}; \frac{3}{4}], [\frac{3}{4}; 1], [1; 2]$  qism kesmalarga ajratadi.  $f(x)=1-x$  funksiya qaralayotgan kesmalarda kamayuvchi bo‘lganligi uchun, o‘zining  $M_i (i=1,4)$  maksimal qiymatlarini, qism kesmalarning chap chetki nuqtalarida,  $m_i (i=1,4)$  minimal qiymatlarini esa, kesmalarning o‘ng chetki nuqtalarida qabul qiladi.

Demak,

$$M_1 = f(x_0) = 1 - 0 = 1; \quad M_2 = f\left(\frac{1}{3}\right) = 1 - \frac{1}{3} = \frac{2}{3};$$

$$M_3 = f\left(\frac{3}{4}\right) = 1 - \frac{3}{4} = \frac{1}{4}; M_4 = f(1) = 1 - 1 = 0,$$

$$m_1 = f\left(\frac{1}{3}\right) = \frac{2}{3}; m_2 = f\left(\frac{3}{4}\right) = \frac{1}{4}; m_3 = f(1) = 1 - 1 = 0; m_4 = f(2) = -1.$$

$\Delta x_i (i=1,4)$  qism kesmalarining uzunliklarini hisoblaymiz:

$$\Delta x_1 = \frac{1}{3} - 0 = \frac{1}{3}; \Delta x_2 = \frac{3}{4} - \frac{1}{3} = \frac{5}{12}; \Delta x_3 = 1 - \frac{3}{4} = \frac{1}{4}; \Delta x_4 = 2 - 1 = 1.$$

Shunday qilib, Darbu yig'indilari:

$$S_{P_1}(f) = M_1 \Delta x_1 + M_2 \Delta x_2 + M_3 \Delta x_3 + M_4 \Delta x_4 = 1 \cdot \frac{1}{3} + \frac{2}{3} \cdot \frac{5}{12} + \frac{1}{4} \cdot \frac{1}{4} + 0 \cdot 1 = \frac{87}{144},$$

$$S_{P_1}(f) = m_1 \Delta x_1 + m_2 \Delta x_2 + m_3 \Delta x_3 + m_4 \Delta x_4 = \frac{2}{3} \cdot \frac{1}{3} + \frac{1}{4} \cdot \frac{5}{12} + 0 \cdot \frac{1}{4} + (-1) \cdot 15 = -\frac{97}{144}.$$

Bunda,  $s_{P_1}(f) < S_{P_1}(f)$ .

2)  $P_2$  bo'linish,  $[0, 2]$  kesmani,

$$[0; \frac{1}{6}], [\frac{1}{6}; \frac{1}{3}], [\frac{1}{3}; \frac{2}{3}], [\frac{2}{3}; \frac{3}{4}], [\frac{3}{4}; 1], [1, \frac{3}{2}], [\frac{3}{2}; 2]$$

qism kesmalarga ajratadi.

Berilgan funksiya qaralayotgan kesmada uzliksiz, kamayuvchi bo'lganligi uchun, u o'zining  $M_i (i=1,7)$  maksimal qiymatlarini, kesmalarning chap chetki nuqtalarida,  $m_i (i=1,7)$  minimal qiymatlarini kesmalarning o'ng chetki nuqtalarida qabul qiladi, ya'ni

$$M_1 = f(0) = 1 - 0 = 1, M_2 = f\left(\frac{1}{6}\right) = 1 - \frac{1}{6} = \frac{5}{6}, M_3 = f\left(\frac{1}{3}\right) = \frac{2}{3}, M_4 = f\left(\frac{2}{3}\right) = 1 - \frac{2}{3} = \frac{1}{3},$$

$$M_5 = f\left(\frac{3}{4}\right) = 1 - \frac{3}{4} = \frac{1}{4}, M_6 = f(1) = 1 - 1 = 0, M_7 = f\left(\frac{3}{2}\right) = 1 - \frac{3}{2} = -\frac{1}{2},$$

$$m_1 = f\left(\frac{1}{6}\right) = \frac{5}{6}, m_2 = f\left(\frac{1}{3}\right) = \frac{2}{3}, m_3 = f\left(\frac{2}{3}\right) = \frac{1}{3}, m_4 = f\left(\frac{3}{4}\right) = \frac{1}{4},$$

$$m_5 = f(1) = 1 - 1 = 0, m_6 = f\left(\frac{3}{2}\right) = -\frac{1}{2}, m_7 = f(2) = -1.$$

$\Delta x_i (i=1,7)$  qism kesmalarning uzunliklarini hisoblaymiz:

$$\Delta x_1 = \frac{1}{6}; \Delta x_2 = \frac{1}{6}; \Delta x_3 = \frac{1}{3}; \Delta x_4 = \frac{1}{12}; \Delta x_5 = \frac{1}{4}; \Delta x_6 = \frac{1}{2}; \Delta x_7 = \frac{1}{2}$$

U holda,

$$S_{P_2}(f) = \sum_{i=1}^7 m_i \Delta x_i = \frac{5}{6} \cdot \frac{1}{6} + \frac{2}{3} \cdot \frac{1}{6} + \frac{1}{3} \cdot \frac{1}{3} + \frac{1}{4} \cdot \frac{1}{12} + 0 \cdot \frac{1}{4} + \left(-\frac{1}{2}\right) \cdot \frac{1}{2} + (-1) \cdot \frac{1}{2} = -\frac{45}{144},$$

$$S_{P_2}(f) = \sum_{i=1}^7 M_i \Delta x_i = 1 \cdot \frac{1}{6} + \frac{5}{6} \cdot \frac{1}{6} + \frac{2}{3} \cdot \frac{1}{3} + \frac{1}{3} \cdot \frac{1}{12} + \frac{1}{4} \cdot \frac{1}{4} + 0 \cdot \frac{1}{2} + \left(-\frac{1}{2}\right) \cdot \frac{1}{2} = \frac{65}{144}.$$

Demak,  $s_{P_2}(f) < S_{P_2}(f)$ .

Endi,  $P_1$  va  $P_2$  bo'linishlarga mos kelgan, Darbu yig'indilarini taqqoslaymiz:

$$s_{P_1}(f) = -0,673; \quad S_{P_1}(f) = \frac{87}{144} \approx 0,6042,$$

$$s_{P_2}(f) = -\frac{45}{144} = -0,312, \quad S_{P_2}(f) = \frac{65}{144} = 0,451;$$

$$s_{P_1}(f) < s_{P_2}(f), \quad S_{P_1}(f) > S_{P_2}(f),$$

ya'ni bu holda ham,  $P$  bo'linishga yangi bo'linish nuqtalarini qo'shish bilan, Darbuning quyisi yig'indisi kamaymasligi, yuqori yig'indisining ortmasligiga ishonch hosil qilamiz.

### 6.3. Aniq integral yordamida limitlarni hisoblash.

#### 6.12-misol. Ushbu

$$\lim_{n \rightarrow \infty} \left( \frac{n}{n^2 + 1^2} + \frac{n}{n^2 + 2^2} + \dots + \frac{n}{n^2 + n^2} \right)$$

limitni hisoblang.

**Yechilishi.**  $S_n = \frac{n}{n^2 + 1^2} + \frac{n}{n^2 + 2^2} + \dots + \frac{n}{n^2 + n^2}$  deb belgilaymiz. Bu yig'indini quyidagi ko'rinishda yozib olamiz:

$$\sigma_n = \frac{1}{n} \sum_{i=1}^n \frac{1}{1 + \left(\frac{i}{n}\right)^2}.$$

$$\text{Bunda } \frac{1}{1 + \left(\frac{1}{n}\right)^2}, \frac{1}{1 + \left(\frac{2}{n}\right)^2}, \dots, \frac{1}{1 + \left(\frac{n}{n}\right)^2} \quad \text{qo'shiluvchilar, } \frac{1}{1 + x^2}$$

funksiyaning  $x_1 = \frac{1}{n}, x_2 = \frac{2}{n}, \dots, x_n = \frac{n}{n} = 1$  nuqtalardagi qiymatlarini ifoda qiladi.  $[0; 1]$  kesmaning regulyar  $P = \{x_0 = 0 < x_1 < x_2, \dots, < x_{n-1} < x_n = 1\}$  bo'linishini olamiz:  $[0; 1] = [0; x_1] \cup [x_1; x_2] \cup \dots \cup [x_{n-1}; x_n]$ , bunda  $\Delta x_i = x_i - x_{i-1} = \frac{1}{n}$ .

Ma'lumki, ta'rifga asosan, integral yig'indining limiti, qism kesmalardan olingan  $\xi_i$  nuqtalarni tanlashga bog'liq emas. Shuning

$$\text{uchun, } \xi_i = x_i \text{ deb olsak, u holda, } \sigma_n = \sum_{i=1}^n f(\xi_i) \Delta x_i = \sum_{i=1}^n \frac{1}{1 + \left(\frac{i}{n}\right)^2} \cdot \frac{1}{n}$$

yig'indi,  $f(x) = \frac{1}{1 + x^2}$  funksiyaning,  $[0; 1]$  kesmadagi Riman integral yig'indisi bo'lib hisoblanadi.

Demak, ta'rifga asosan,

$$\lim_{n \rightarrow \infty} \left( \frac{n}{n^2 + 1^2} + \frac{n}{n^2 + 2^2} + \dots + \frac{n}{n^2 + n^2} \right) = \int_0^1 \frac{1}{1 + x^2} dx = \arctgx|_0^1 = \frac{\pi}{4}.$$

### 6.13-misol. Ushbu

$$\lim_{n \rightarrow \infty} \frac{1}{n} \left( \sqrt{1 + \frac{1}{n}} + \sqrt{1 + \frac{2}{n}} + \dots + \sqrt{1 + \frac{n}{n}} \right)$$

limitni hisoblang.

**Yechilishi.** Ravshanki,  $\sigma_n = \frac{1}{n} \sum_{i=1}^n \sqrt{1 + \frac{i}{n}}$  yig'indi,  $f(x) = \sqrt{1+x}$

funksiyaning,  $[0;1]$  kesmani teng  $n$  ta bo'lakka bo'lgandagi, integral yig'indisini ifodalarydi. Shuning uchun,

$$\lim_{n \rightarrow \infty} \sigma_n = \int_0^1 \sqrt{1+x} dx = \frac{2}{3} \sqrt{(1+x)^3} \Big|_0^1 = \frac{2}{3} (2\sqrt{2} - 1).$$

### Mustaqil yechish uchun misollar

**6.1.**  $f(x) = x+1$  funksiya uchun  $[-1; 2]$  kesmani teng  $n$  ta bo'lakka bo'lib, hamda  $\xi_i$  ( $i=1, n$ ) nuqtani  $[x_{i-1}; x_i]$  kesmaning o'rtasi deb olib,  $\sigma_n(f)$  integral yig'indini tuzing.

Quyidagi berilgan  $f(x)$  funksiya uchun ko'rsatilgan kesmani teng  $n$  ta bo'lakka bo'lib, Darbuning  $s_p(f)$  va  $S_p(f)$  yig'indilarini tuzing:

**6.2.**  $f(x) = x^3$ ,  $x \in [-2, 3]$ . **6.3.**  $f(x) = \sqrt{x}$ ,  $x \in [0; 1]$ .

**6.4.**  $f(x) = 2^x$ ,  $x \in [0, 10]$ .

**6.5.**  $f(x) = x^4$  funksiya uchun,  $[1; 2]$  kesmani, uzunliklari geometrik progressiya tashkil etadigan  $n$  ta bo'laklarga bo'lib, Darbuning quyi yig'indisini tuzing va uning  $n \rightarrow \infty$  dagi limitini toping.

Quyidagi berilgan  $f(x)$  funksiya uchun, berilgan kesmaning berilgan  $P$  bo'linishiga mos, Darbuning quyi va yuqori yig'indilarini tuzing:

**6.6.**  $f(x) = 2x$ ,  $x \in [0; 1]$ ,  $P = \left\{ 0, \frac{1}{4}, \frac{1}{2}, 1 \right\}$ .

**6.7.**  $f(x) = x^2$ ,  $x \in [-1; 0]$ ,  $P = \left\{ -1, -\frac{1}{2}, -\frac{1}{4}, 0 \right\}$ .

**6.8.**  $f(x) = x^3 + 1$ ,  $x \in [0; 1]$ ,  $P = \left\{ 0, \frac{1}{2}, 1 \right\}$ .

**6.9.**  $f(x) = x^2$ ,  $x \in [-1; 1]$ ,  $P = \left\{ -1, -\frac{1}{4}, \frac{1}{4}, \frac{1}{2}, 1 \right\}$ .

**6.10.**  $f(x) = \sin x$ ,  $x \in [0; \pi]$ ,  $P = \left\{ 0, \frac{\pi}{6}, \frac{\pi}{2}, \pi \right\}$ .

Quyidagi berilgan  $f(x)$  funksiya uchun, ko'rsatilgan kesmaning  $P$  bo'linishi va qism kesmalarda tanlangan  $\xi_i$  ( $i=1, n$ ) nuqtalarga mos

kelgan  $\sigma_P(f)$  Riman integral yig'indisini tuzing va uning qanday figuraning yuzini ifodalashini chizmada ko'rsating:

$$6.11. f(x) = x^2, x \in [0;1], P = \{0, \frac{1}{4}, \frac{1}{2}, \frac{3}{4}, 1\}, \xi_1 = \frac{1}{8}, \xi_2 = \frac{3}{8}, \xi_3 = \frac{5}{8}, \xi_4 = \frac{7}{8}.$$

$$6.12. f(x) = \frac{3}{2}x + 1, x \in [0;2], P = \{0, \frac{1}{4}, \frac{3}{4}, 1, \frac{3}{2}, 2\}, \xi_1 = \frac{1}{8}, \xi_2 = \frac{1}{2},$$

$$\xi_3 = \frac{7}{8}, \xi_4 = \frac{5}{4}, \xi_5 = \frac{7}{4}.$$

$$6.13. f(x) = 2x, x \in [0;1], P = \{0, \frac{1}{8}, \frac{1}{4}, \frac{1}{2}, \frac{2}{3}, 1\}, \xi_1 = \frac{1}{16}, \xi_2 = \frac{3}{16},$$

$$\xi_3 = \frac{3}{8}, \xi_4 = \frac{1}{8}, \xi_5 = \frac{7}{8}.$$

Quyidagi integrallarni, Riman integral yig'indisining limiti sifatida qarab, hisoblang:

$$6.14. \int_0^{\frac{\pi}{2}} \sin x dx.$$

$$6.15. \int_1^2 \frac{dx}{x}$$

$$6.16. \int_0^{10} 3^x dx.$$

$$6.17. \int_a^b e^{kx} dx.$$

$$6.18. \int_0^1 x^2 dx.$$

$$6.19. \int_0^1 x(1-x^2) dx.$$

$$6.20. \int_a^b \frac{1}{x^2} dx \quad (0 < a < b) \quad (\xi_i = \sqrt{x_i x_{i-1}}, \quad (i=0, n) \text{ deb oling}).$$

6.21.  $\int_1^e \ln x dx$  ( $[1; e]$  kesmani geometrik progressiyani tashkil qiladi gan nuqtalar yordamida qism kesmalarga bo'ling ).

6.22. Ushbu  $\int x^3 dx$  integralni quyidagi shartlarda:

1)  $[1; 4]$  kesmani teng bo'laklarga bo'lib,  $\xi_i$  nuqta sifatida qism kesmalarning chap chetki nuqtalarini olib;

2)  $[1; 4]$  kesmani teng bo'laklarga bo'lib,  $\xi_i$  nuqta sifatida qism kesmalarning o'ng chetki nuqtalarini olib;

3)  $[1; 4]$  kesmani teng bo'laklarga bo'lib,  $\xi_i$  nuqta sifatida qism kesmalarning o'rta nuqtalarini olib;

4)  $[1; 4]$  kesmani  $x_0, x_1, x_2, \dots, x_n$  (bunda  $x_k = q^k, q = \sqrt[4]{4}$ ) nuqtalar yordamida bo'lib,  $\xi_i$  nuqta sifatida, qism kesmalarning chap chetki nuqtalarini olib;

5) [1; 4] kesmani  $x_0, x_1, x_2, \dots, x_n$  (bunda  $x_k = q^k, q = \sqrt[4]{4}$ ) nuqtalar yordamida bo'lib,  $\xi$ , nuqta sifatida, qism kesmalarning o'ng chetki nuqtalarini olib, hisoblang.

**6.23.** Ushbu  $f(x) = \operatorname{sgn}(\sin \frac{\pi}{x})$ , uzilishga ega, funksiyaning  $[0; 1]$  kesmada integrallanuvchiligidini isbotlang.

**6.24.** Ushbu

$$\varphi(x) = \begin{cases} 0, & x - \text{irrational son bo'lganda}, \\ \frac{1}{n}, & x = \frac{m}{n} \text{ bo'lganda} \end{cases}$$

(bunda,  $m$  va  $n (n > 1)$  lar o'zaro tub butun sonlar) Riman funksiyasining ixtiyoriy chekli kesmada integrallanuvchiligidini isbotlang.

**6.25.** Aniq integralning tarifiga ko'ra, agar  $f(x)$  funksiya biror kesmada integrallanuvchi bo'lsa, u holda uning shu kesmada chegaralangan bo'lishini isbotlang.

**6.26.** Agar  $f(x)$  funksiya  $[a, b]$  kesmada integrallanuvchi bo'lsa, u holda,

$$\lim_{\lambda \rightarrow 0} s_p(f) = \lim_{\lambda \rightarrow 0} S_p(f) = \int_a^b f(x) dx$$

ekanligini isbotlang ( $\lambda = \max |\Delta x_i|$ ).

Aniq integral yordamida, quyidagi yig'indilarning limitini hisoblang:

$$6.27. \lim_{n \rightarrow \infty} \left( \frac{1}{n+1} + \frac{1}{n+2} + \dots + \frac{1}{n+n} \right).$$

$$6.28. \lim_{n \rightarrow \infty} \left( \frac{1}{n^2} + \frac{2}{n^2} + \dots + \frac{2n-1}{n^2} \right).$$

$$6.29. \lim_{n \rightarrow \infty} \frac{1}{n} \left( e^{\frac{1}{n}} + e^{\frac{2}{n}} + \dots + e^{\frac{n}{n}} \right).$$

$$6.30. \lim_{n \rightarrow \infty} \frac{1}{\sqrt{n}} \left[ 1 + \frac{1}{\sqrt{2}} + \dots + \frac{1}{\sqrt{n}} \right].$$

$$6.31. \lim_{n \rightarrow \infty} \left( \frac{1}{n^2} + \frac{4}{n^2} + \dots + \frac{(n-1)^2}{n^2} \right) \frac{1}{n}.$$

$$6.32. \lim_{n \rightarrow \infty} \left( \frac{1}{n^4} + \frac{8}{n^4} + \dots + \frac{(4n-1)^3}{n^2} \right) \frac{1}{n}.$$

$$6.33. \lim_{n \rightarrow \infty} \frac{1}{n} \left[ 1 + \frac{1}{\cos^2 \frac{\pi}{4n}} + \dots + \frac{1}{\cos^2 \frac{m\pi}{4n}} \right].$$

$$6.34. \lim_{n \rightarrow \infty} \frac{1^\alpha + 2^\alpha + \dots + n^\alpha}{n^{\alpha+1}} (\alpha > 0).$$

$$6.35. \lim_{n \rightarrow \infty} \frac{\sqrt[n]{n!}}{n}.$$

$$6.36. \lim_{n \rightarrow \infty} \sin \frac{\pi}{n} \sum_{k=1}^n \frac{1}{2 + \cos \frac{k\pi}{n}}.$$

$$6.37. \lim_{n \rightarrow \infty} \left( \frac{1}{\sqrt{4n^2-1}} + \frac{1}{\sqrt{4n^2-2^2}} + \dots + \frac{1}{\sqrt{4n^2-2^n}} \right).$$

$$6.38. \lim_{n \rightarrow \infty} \frac{1}{n} \left[ \sin \frac{\pi}{n} + \sin \frac{2\pi}{n} + \dots + \sin \frac{(n-1)\pi}{n} \right].$$

$$6.39. \lim_{n \rightarrow \infty} n \left( \frac{1}{(n+1)^2} + \frac{1}{(n+2)^2} + \dots + \frac{1}{(n+n)^2} \right).$$

$$6.40. \lim_{n \rightarrow \infty} \frac{3}{n} \left[ 1 + \sqrt{\frac{n}{n+3}} + \sqrt{\frac{n}{n+6}} + \dots + \sqrt{\frac{n}{n+3(n-1)}} \right].$$

$$6.41. \lim_{n \rightarrow \infty} \frac{\pi}{2n} \left[ 1 + \cos \frac{2\pi}{2n} + \cos \frac{3\pi}{2n} + \dots + \cos \frac{(n-1)\pi}{n} \right].$$

### Mustaqil yechish uchun misollarning javoblari

$$6.1. \sigma_p(f) = 4,5 \quad 6.2. s_p(f) = 16 \frac{1}{4} - \frac{175}{2n} + \frac{125}{4n^2}, \quad S_p(f) = 16 \frac{1}{4} + \frac{175}{2n} + \frac{125}{4n^2}.$$

**7-§. Aniq integralning mavjudligi. Integrallanuvchi funksiyalarning sinflari. Aniq integralning xossalari**

### 7.1. Aniq integralning mavjudligi.

**7.1-teorema.**  $[a,b]$  kesmada chegaralangan  $f(x)$  funksiya, shu kesmada Darbu ma'nosida integrallanuvchi bo'lishi uchun,  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta = \delta(\varepsilon) > 0$  son topilib,  $[a,b]$  kesmaning diametri  $d(P) < \delta$  bo'lgan har qanday  $P$  bo'linishiga nisbatan, Darbu yig'indilarining,

$$S_p(f) - s_p(f) < \varepsilon \quad (7.1)$$

tengsizlikni qanoatlantirishi zarur va yetarlidir.

Agar  $f(x)$  funksiyaning  $[x_k, x_{k+1}]$  ( $k = \overline{0, n-1}$ ) kesmadagi tebranishini  $\omega_k$  deb belgilasak, u holda (7.1) tengsizlik, quyidagi,

$$\sum_{k=0}^{n-1} \omega_k \Delta x_k < \varepsilon$$

tengsizlikka teng kuchli bo'ladi.

**7.2-teorema.**  $f(x)$  funksiyaning  $[a,b]$  kesmada Riman ma'nosida integrallanuvchi bo'lishi uchun, uning Darbu ma'nosida integrallanuvchi bo'lishi, zarur va etarlidir.

Bu holda, Riman integrali, Darbu ma'nosidagi integralga teng bo'ladi. Biz bundan keyin, «Darbu ma'nosidagi integral» degan terminni ishlatmasdan, o'sha integralni «Riman ma'nosidagi» integral deb ataymiz.

## 7.2. Integrallanuvchi funksiyalarning sinflari.

**7.3 -teorema.** Agar  $f(x)$  funksiya  $[a,b]$  kesmada uzlusiz bo'lsa, u holda,  $f(x)$  funksiya shu kesmada integrallanuvchi bo'ladi.

**7.4 -teorema.** Agar  $f(x)$  funksiya  $[a,b]$  kesmada chegaralangan va monoton bo'lsa, u holda,  $f(x)$  funksiya shu kesmada integrallanuvchi bo'ladi.

**7.5-teorema.** Agar  $f(x)$  funksiya  $[a,b]$  kesmada chegaralangan va kesmaning chekli sondagi nuqtalarida uzilishga ega bo'lib, qolgan barcha nuqtalarida uzlusiz bo'lsa, u holda,  $f(x)$  funksiya shu kesmada integrallanuvchi bo'ladi.

Aniq integralning ta'rifi bo'yicha, ya'ni uni, integral yig'indining limiti sifatida qarab, ba'zi bir sodda funksiyalarning integrallarini hisoblash mumkin. Lekin, ko'pincha, har qanday uzlusiz funksiyaning aniq integralini, integral yig'indining limiti sifatida qarab, hisoblash ancha noqulayliklarga va qiyinchiliklarga olib keladi.

**7.1 -misol.** Ushbu  $\int_0^{\frac{\pi}{2}} \sin x dx$  integralni hisoblang.

**Yechilishi.**  $f(x) = \sin x$  funksiya  $[0; \frac{\pi}{2}]$  kesmada uzlusiz bo'lgani uchun, 7.3-teoremaga ko'ra, u qaralayotgan kesmada integrallanuvchi bo'ladi.

Demak, berilgan funksiyaning  $[0; \frac{\pi}{2}]$  kesma bo'yicha integralini ta'rifga ko'ra hisoblashda,  $[0; \frac{\pi}{2}]$  kesmaning  $P$  bo'linishini, hamda har bir  $[x_k, x_{k+1}]$  qism kesmadan  $\xi_k$  nuqtalarni olib, integral yig'indini tuzish va uning limitini hisoblashga qulay qilib olish imkoniyatiga ega bo'lamiz. Shularni e'tiborga olgan holda,  $[0; \frac{\pi}{2}]$  kesmani  $n$  ta teng bo'lakka bo'lib,  $\xi_k$  ( $k = \overline{0, n-1}$ ) nuqtalar sifatida  $[x_k, x_{k+1}]$  kesmaning chap chetki nuqtalarni olib,  $\sigma_P(f)$  integral yig'indini tuzamiz:

$$\sigma_p(f) = \sigma_p(\sin x) = \frac{\pi}{2n} \sum_{k=0}^{n-1} \sin \frac{k\pi}{2n}$$

$$\sum_{k=1}^n \sin k\alpha = \frac{\sin \frac{(n+1)\alpha}{2} \cdot \sin \frac{n\alpha}{2}}{\sin \frac{\alpha}{2}} \quad \text{formulaga asosan, } \sigma_p(\sin x) \text{ yig'indini,}$$

$$\sigma_p(f) = \frac{\sqrt{2} \cdot \pi}{4n} \cdot \frac{\sin \left( \frac{\pi}{4} - \frac{\pi}{4n} \right)}{\sin \frac{\pi}{4n}}$$

ko'rinishda yozib olamiz.

Endi integral yig'indining  $n \rightarrow \infty$  dagi limitini hisoblaymiz:

$$\lim_{n \rightarrow \infty} \sigma_p(f) = \lim_{n \rightarrow \infty} \frac{\sqrt{2} \cdot \pi}{4n} \cdot \frac{\sin \left( \frac{\pi}{4} - \frac{\pi}{4n} \right)}{\sin \frac{\pi}{4n}} = \sqrt{2} \lim_{n \rightarrow \infty} \sin \left( \frac{\pi}{4} - \frac{\pi}{4n} \right) \cdot \frac{\frac{\pi}{4n}}{\sin \frac{\pi}{4n}}.$$

Bundan,  $f(x) = \sin x$  funksiyaning qaralayotgan kesmada

uzluksizligini, hamda  $\lim_{n \rightarrow \infty} \frac{\frac{\pi}{4n}}{\sin \frac{\pi}{4n}} = 1$  ekanligini e'tiborga olsak, u holda,

$$\lim_{n \rightarrow \infty} \sigma_p(\sin x) = \int_0^{\pi/2} \sin x dx = \sqrt{2} \cdot \sin \frac{\pi}{4} = 1$$

bo'ladi.

Demak,  $f(x) = \sin x$  funksiya  $[0; \frac{\pi}{2}]$  kesmada uzluksiz bo'lgani uchun, u integrallanuvchi bo'lar ekan.

Agar  $g(x)$  funksiya  $[a, b]$  kesmada aniqlangan va kesmaning chekli sondagi nuqtalarida,  $f(x)$  funksiyaning qiymatlaridan farqli (boshqa) qiymatlar qabul qilsa, u holda,  $g(x)$  funksiya  $[a, b]$  kesmada integrallanuvchi bo'ladi va

$$\int_a^b g(x) dx = \int_a^b f(x) dx$$

tenglik o'rinni.

## 7.2-misol. Ushbu

$$f(x) = \begin{cases} \sin \frac{1}{x}, & 0 < x \leq 1 \text{ bo'lganda,} \\ 5, & x = 0 \text{ bo'lganda.} \end{cases}$$

funksiyani  $[0; 1]$  kesmada integrallanuvchi ekanligini ko'rsating.

**Yechilishi.** Berilgan funksiya,  $[0; 1]$  kesmada chegaralangan va kesmaning  $x = 0$  nuqtasida uzilishga ega bo'lib, qolgan barcha nuqtalarida uzluksiz.

Demak, 7.5-teoremaga asosan, berilgan funksiya,  $[0; 1]$  kesmada integrallanuvchi bo'ladi.

$$7.3\text{-misol. } g(x) = \begin{cases} 2, & x \in [0, 3) \cup (3, 4] \\ 7, & x = 3 \end{cases}$$

funksiyaning  $[0, 4]$  kesmada integrallanuvchi ekanligini ko'rsating va integralni hisoblang.

**Yechilishi.** Berilgan funksiya, o'zgarmas  $f(x) = 2, x \in [0, 4]$  funksiyadan, faqat  $x = 3$  nuqtada farq qiladi.

Ravshanki,

$$\int_0^4 f(x) dx = 8.$$

Endi,  $[0, 4]$  kesmaning ixtiyoriy  $P$  (regular yoki regular bo'limgan) bo'linishida, 8 soni  $s_p(g) \leq I \leq S_p(g)$  tengsizliklarni qanoatlantiradigan yagona  $\iota$  sondan iboratligini ko'rsatsak,

$$\int_0^4 g(x) dx = 8$$

bo'lishi ko'rsatilgan (isbotlangan) bo'ladi.

$P-[0, 4]$  kesmaning ixtiyoriy bo'linishi bo'lsin. Bu bo'linishdan hosil bo'lgan  $[x_{i-1}, x_i]$  qism kesmalarning har birida  $m_i = \min_{x \in [x_{i-1}, x_i]} g(x) = 2, i = 1, 2, \dots, n, M_i = \max_{x \in [x_{i-1}, x_i]} g(x) \geq 2, i = 1, 2, \dots, n$ . U holda, quiy Darbu yig'indisi,

$$s_p(g) = 2 \cdot \Delta x_1 + 2 \cdot \Delta x_2 + \dots + 2 \cdot \Delta x_n = 2(\Delta x_1 + \dots + \Delta x_n) = 2 \cdot \Delta x = 2 \cdot 4 = 8,$$

va yuqori Darbu yig'indisi,

$$S_p(g) \geq 2 \cdot \Delta x_1 + 2 \cdot \Delta x_2 + \dots + 2 \cdot \Delta x_n = 2(\Delta x_1 + \dots + \Delta x_n) = 2 \cdot \Delta x = 2 \cdot 4 = 8$$

bo'ladi.

Shunday qilib,  $[0, 4]$  kesmaning barcha  $P$  bo'linishlarida,  $s_p(g) \leq 8 \leq S_p(g)$  tengsizliklar o'rini.

Endi yagonalikni isbotlaymiz.  $[0, 4]$  kesmaning barcha  $P$  bo'linishlarida,

$$s_p(g) \leq I \leq S_p(g) \tag{7.2}$$

bo'lsin, deb faraz qilamiz.  $s_p(g) = 8$  munosabat, barcha  $P$  bo'linishlar uchun bajarilganligidan,  $\iota$ , hech bo'limganda, 8 ga teng bo'ladi. Endi, faraz qilaylikki,  $\iota > 8$  bo'lsin va  $[0, 4]$  kesmaning  $P$  bo'linishini shunday o'zgartiramizki,  $\lambda_p = \max|\Delta x_i| < \frac{1}{5}(I - 8)$  va  $0 = x_0 < x_1 < \dots < x_{i-1} < 3 < x_i < \dots < x_n = 4$  bo'lsin, U holda,

$$S_p(g) = 2\Delta x + \dots + 2\Delta x_{i-1} + 7\Delta x_i + 2\Delta x_{i+1} + \dots + 2\Delta x_n = \\ = 2(\Delta x + \Delta x_2 + \Delta x_3 + \dots + \Delta x_n) + 5\Delta x_i = 8 + 5\Delta x_i < 8 + \frac{5}{5}(I - 8) = I$$

bo'lishi kelib chiqadi, bundan,  $I$  sonning (7.2) munosabatni qanoatlantirmasligi kelib chiqadi. Bu qarama-qarshilik,  $I$  sonning 8 dan katta bo'lmagligini, ya'ni  $I = 8$  bo'lishini isbotlaydi.

**7.3. Aniq integralning xossalari.** Aniq integralning, ta'rifdan bevosita kelib chiqadigan, quyidagi xossalarini keltiramiz:

$$1^0. \int_a^b dx = b - a.$$

2<sup>0</sup>. Agar  $f(x)$  funksiya  $[a,b]$  kesmada integrallanuvchi bo'lsa, u istalgan  $[\alpha, \beta] \subset [a,b]$  kesmada ham integrallanuvchi bo'ladi.

3<sup>0</sup>. Agar  $f(x)$  funksiya  $[a,c] \cup [c,b]$  kesmalarda integrallanuvchi bo'lsa, u holda,  $f(x)$  funksiya  $[a,b]$  da ham integrallanuvchi bo'ladi va ushbu

$$\int_a^b f(x)dx = \int_a^c f(x)dx + \int_c^b f(x)dx, \quad a \leq c \leq b, \quad (7.3)$$

tenglik o'rinli.

4<sup>0</sup>. Agar  $f(x)$  va  $g(x)$  funksiyalar  $[a, b]$  da integrallanuvchi bo'lsa, u holda,  $\forall \lambda, \mu \in R$  lar uchun  $\lambda f(x) + \mu g(x)$  funksiya ham  $[a, b]$  kesmada integrallanuvchi bo'ladi va

$$\int_a^b [\lambda f(x) + \mu g(x)]dx = \lambda \int_a^b f(x)dx + \mu \int_a^b g(x)dx \quad (7.4)$$

tenglik o'rinli.

**7.1 -natija.** Agar  $f_1(x), f_2(x), \dots, f_n(x)$  funksiyalar  $[a, b]$  kesmada integrallanuvchi bo'lsa, u holda,  $C_1 f_1(x) + C_2 f_2(x) + \dots + C_n f_n(x)$

( $C_k = const, k = \overline{1, n}$ ) funksiya ham shu kesmada integrallanuvchi bo'ladi va

$$\int_a^b [C_1 f_1(x) + \dots + C_n f_n(x)]dx = C_1 \int_a^b f_1(x)dx + \dots + C_n \int_a^b f_n(x)dx \quad (7.5)$$

tenglik o'rinli.

5<sup>0</sup>. Agar  $f(x)$  va  $g(x)$  funksiyalar  $[a, b]$  kesmada integrallanuvchi bo'lsa, u holda, ularning  $f(x)g(x)$  ko'paytmasi ham shu kesmada integrallanuvchi bo'ladi.

**7.2-natija.** Agar  $f(x)$  funksiya  $[a, b]$  kesmada integrallanuvchi bo'lsa,  $\forall n \in N$  uchun,  $[f(x)]^n$  funksiya ham shu kesmada integrallanuvchi bo'ladi.

6<sup>0</sup>. Agar  $f(x)$  funksiya  $[a, b]$  kesmada integrallanuvchi bo‘lib,  $\forall x \in [a, b]$  uchun,  $f(x) \geq 0$  tengsizlik o‘rinli bo‘lsa, u holda,

$$\int_a^b f(x)dx \geq 0 \quad (a > b)$$

tengsizlik o‘rinli.

**7.3-natija.** Agar  $f(x)$  va  $g(x)$  funksiyalar  $[a, b]$  kesmada integrallanuvchi bo‘lib,  $\forall x \in [a, b]$  uchun,  $f(x) \leq g(x)$  tengsizlik o‘rinli bo‘lsa, u holda,

$$\int_a^b f(x)dx \leq \int_a^b g(x)dx \quad (7.6)$$

tengsizlik o‘rinli.

7<sup>0</sup>. Agar  $f(x)$  funksiya  $[a, b]$  kesmada integrallanuvchi bo‘lsa,  $|f(x)|$  funksiya ham shu kesmada integrallanuvchi bo‘ladi va

$$\left| \int_a^b f(x)dx \right| \leq \int_a^b |f(x)|dx \quad (7.7)$$

tengsizlik o‘rinli.

Bu xossaning teskarisi har doim ham o‘rinli emas, ya’ni  $|f(x)|$  funksiyaning shu kesmada integrallanuvchi ekanligidan,  $f(x)$  funksiyaning integrallanuvchi ekanligi kelib chiqmaydi.

8<sup>0</sup>. Agar  $f(x)$  funksiya  $[a, b]$  kesmada integrallanuvchi bo‘lsa, u holda, shunday  $\mu$  o‘zgarmas son ( $m \leq \mu \leq M$ ) mavjud bo‘ladi va

$$\int_a^b f(x)dx = \mu(b-a) \quad (7.8)$$

tenglik o‘rinli, bunda  $m = \inf_{a \leq x \leq b} \{f(x)\}$ ,  $M = \sup_{a \leq x \leq b} \{f(x)\}$ .

9<sup>0</sup>(o‘rta qiymat haqidagi teorema). Agar  $f(x)$  va  $g(x)$  funksiyalar  $[a, b]$  kesmada integrallanuvchi bo‘lib,  $g(x)$  funksiya shu kesmada o‘z ishorasini saqlasa, u holda, shunday  $\mu$  o‘zgarmas son ( $m \leq \mu \leq M$ ) mavjud bo‘ladi va

$$\int_a^b f(x)g(x)dx = \mu \int_a^b g(x)dx \quad (7.9)$$

tenglik o‘rinli.

**7.4-natija.** Agar  $f(x)$  funksiya  $[a, b]$  kesmada uzlusiz bo‘lsa, u holda,  $[a, b]$  kesmada shunday  $\xi$  ( $\xi \in [a, b]$ ) mavjud bo‘ladi va

$$\int_a^b f(x)g(x)dx = f(\xi)(b-a) \quad (7.10)$$

tenglik o‘rinli.

Agar  $f(x)$  funksiya  $[a, b]$  kesmada integrallanuvchi bo'lsa ( $a \leq b$ ), u holda u aniq integralning  $2^0$ -xossasiga asosan,  $[a, x]$  ( $a \leq x \leq b$ ) kesmada ham integrallanuvchi bo'ladi. Aniq integralning yuqori chegarasi  $b$  ni  $x$  ga, integral ostidagi ifodada  $x$  o'zgaruvchini  $t$  ga almashtirsak, u holda,

$$\int_a^x f(t) dt$$

$x$  ga bog'liq ifoda hosil bo'ladi, uni  $\Phi(x)$  orqali belgilaymiz:

$$\Phi(x) = \int_a^x f(t) dt \quad (7.11)$$

Bu funksiya quyidagi xossalarga ega:

10<sup>0</sup>. Agar  $f(x)$  funksiya  $[a, b]$  kesmada integrallanuvchi bo'lsa, u holda,

$$\Phi(x) = \int_a^x f(t) dt \quad \text{va} \quad F(x) = \int_x^b f(t) dt$$

funksiyalar ham shu kesmada uzlusiz bo'ladi.

11<sup>0</sup>. Agar  $f(x)$  funksiya  $[a, b]$  kesmada integrallanuvchi bo'lib, biror  $x_0 \in [a, b]$  nuqtada uzlusiz bo'lsa, u holda,  $\Phi(x)$  va  $F(x)$  funksiyalar ham  $x_0$  nuqtada differensiallanuvchi bo'ladi va

$$\Phi'(x_0) = f(x_0), \quad F'(x_0) = -f(x_0) \quad (7.12)$$

tengliklar o'rinni.

**7.1-eslatma.** Agar  $x_0$  nuqta,  $[a, b]$  kesmaning chetki nuqtalari bilan ustma-ust tushsa, u holda,  $\Phi(x)$  funksianing  $x_0$  nuqtadagi hosilasi, o'ng yoki chap hosila deb tushuniladi.

**7.5-natija.**  $[a, b]$  kesmada uzlusiz bo'lgan har qanday  $f(x)$  funksiya, shu kesmada boshlangich funksiyaga ega bo'ladi. Shu boshlang'ich funksiyalardan biri

$$\int f(x) dx = \int_a^x f(t) dt + C \quad (7.13)$$

bo'ladi. Bu formula aniqmas integral bilan aniq integral orasidagi boshlanishni ifoda qiladi.

**7.4-misol.** Ushbu

$$f(x) = \begin{cases} x, & 0 \leq x < 1/2 \text{ bo'lganda}, \\ 1, & 1/2 \leq x \leq 1 \text{ bo'lganda}. \end{cases}$$

funksianing  $[0, 1]$  kesmada integrallanuvchi ekanligini ko'rsating.

**Yechilishi.** Berilgan funksiya  $[0; 1]$  kesmada chegaralangan va kesmaning  $x = \frac{1}{2}$  nuqtasida uzilishga ega bo'lib, qolgan barcha nuqtalarida uzlusiz.

Demak, 7.5-teorema va  $3^0$ -xossaga asosan, berilgan funksiya,  $[0; 1]$  kesmada integrallanuvchi bo'ladi, ya'ni

$$\int_0^1 f(x)dx = \int_0^{1/2} xdx + \int_{1/2}^1 1dx = \frac{1}{8} + \frac{1}{2} = \frac{5}{8}.$$

**7.5-misol.**  $P(x)$  funksiya  $[a, b]$  kesmada integrallanuvchi va manfiy emas,  $f(x)$  funksiya esa,  $[a, b]$  kesmada  $m \leq f(x) \leq M$  munosabatlarni qanoatlantirsin. Agar  $f(x)P(x)$  funksiya shu kesmada integrallanuvchi bo'lsa, u holda,

$$m \int_a^b P(x)dx \leq \int_a^b P(x)f(x)dx \leq M \int_a^b P(x)dx \quad (7.14)$$

tengsizliklar bajarilishini isbotlang.

**Yechilishi.** Shartga ko'ra,  $\forall a \leq x \leq b$  uchun,  $m \leq f(x) \leq M$  bo'lganligidan,  $mP(x) \leq f(x)P(x) \leq MP(x)$  tengsizliklar o'rinni. Bu tengsizliklarni,  $a$  dan  $b$  gacha, hadma – had integrallash natijasida, (7.14) tengsizliklarni hosil qilamiz.

**7.6-misol.**  $P(x), f(x), \varphi(x), \psi(x)$  funksiyalar  $[a, b]$  kesmada berilgan bo'lib, ular quyidagi shartlarni qanoatlantirsin:

a)  $P(x)$  – manfiy emas;

b)  $\varphi(x) \leq f(x) \leq \psi(x)$ ;

c)  $f(x)P(x), \varphi(x)P(x), \psi(x)P(x)$  funksiyalar  $[a, b]$  kesmada integrallanuvchi bo'lsin. U holda,

$$\int_a^b \varphi(x)P(x)dx \leq \int_a^b f(x)P(x)dx \leq \int_a^b \psi(x)P(x)dx \quad (7.15)$$

tengsizlik bajarilishini isbotlang.

**Yechilishi.** Shartga ko'ra,  $P(x) \geq 0$ ,  $\varphi(x) \leq f(x) \leq \psi(x)$  bo'lganligi uchun,  $\varphi(x)P(x) \leq f(x)P(x) \leq \psi(x)P(x)$  tengsizliklar ham o'rinni bo'ladi. Bundan (7.15) tengsizliklar kelib chiqadi.

**7.7-misol.** Ushbu

$$0 < \int_0^{\pi} \frac{\sin x}{\sqrt[3]{x^2 + 2}} dx < \frac{\pi}{\sqrt[3]{2}}$$

tengsizliklarni isbotlang.

**Yechilishi.**  $P(x) = \sin x$ ,  $f(x) = \frac{1}{\sqrt{x^2 + 2}}$  deb belgilaylik.  $[0; \pi]$  kesmada

$$0 < \frac{1}{\sqrt{x^2 + 2}} < \frac{1}{\sqrt{2}}, \quad \sin x \geq 0. \quad \text{7.5-misoldagi (7.14) tengsizliklarga ko'ra,}$$

$$0 < \int_0^\pi \frac{\sin x}{\sqrt{x^2 + 1}} dx < \frac{1}{\sqrt{2}} \int_0^\pi \sin x dx < \frac{\pi}{\sqrt{2}}$$

ekanligi isbotlanadi.

**7.8-misol.** Ushbu

$$\frac{1}{10\sqrt{3}} \leq \int_0^1 \frac{x^9}{\sqrt{2+x^2}} dx \leq \frac{1}{\sqrt{210}}$$

tengsizliklarni isbotlang.

**Yechilishi.**  $P(x) = x^9$ ,  $f(x) = \frac{1}{\sqrt{2+x^2}}$  deb belgilasak, u holda,  $[0; 1]$

kesmada  $P(x) \geq 0$  va integrallanuvchi,  $\frac{1}{\sqrt{3}} \leq f(x) \leq \frac{1}{\sqrt{2}}$ , hamda  $f(x) \cdot P(x)$  funksiya integrallanuvchi.

Demak, 7.5-misoldagi (7.14) tengsizliklarga ko'ra,

$$\frac{1}{\sqrt{3}} \int_0^1 x^9 dx \leq \int_0^1 \frac{x^9}{\sqrt{2+x^2}} dx \leq \frac{1}{\sqrt{2}} \int_0^1 x^9 dx.$$

Bundan,  $\frac{1}{10\sqrt{3}} \leq \int_0^1 \frac{x^9}{\sqrt{2+x^2}} dx \leq \frac{1}{\sqrt{2} \cdot 10}$  tengsizliklarning o'rinni ekanligini

olamiz.

**7.9-misol.**  $x - \frac{x^3}{6} \leq \sin x \leq x$ ,  $x \geq 0$  tengsizliklardan foydalanib, ushbu

$$\frac{20\sqrt{2}}{21} \leq \int_0^2 \frac{\sin x}{\sqrt{x}} dx \leq \frac{4\sqrt{2}}{3}$$

tengsizliklarni isbotlang.

**Yechilishi.**  $[0; 2]$  kesmada  $\sqrt{x} \geq 0$  bo'lganligi uchun, 7.6-misoldagi (7.15) tengsizliklarga asosan,

$$\int_0^2 \frac{x - \frac{x^3}{6}}{\sqrt{x}} dx \leq \int_0^2 \frac{\sin x}{\sqrt{x}} dx \leq \int_0^2 \frac{x}{\sqrt{x}} dx.$$

Bundan,

$$\int_0^2 \frac{x - \frac{x^3}{6}}{\sqrt{x}} dx = \int_0^2 \left( x^{\frac{1}{2}} - \frac{1}{6} x^{\frac{5}{2}} \right) dx = 4 \cdot \frac{\sqrt{2}}{3} - \frac{1}{6} \cdot \frac{2^{\frac{7}{2}}}{7} = \frac{20\sqrt{2}}{21}.$$

$$\int_0^2 \frac{x}{\sqrt{x}} dx = \int_0^2 x^{\frac{1}{2}} dx = \frac{4\sqrt{2}}{3}$$

bo'lganligidan,

$$\frac{20\sqrt{2}}{21} \leq \int_0^1 \frac{\sin x}{\sqrt{x}} dx \leq \frac{4\sqrt{2}}{3}$$

tengsizliklarning o‘rinli ekanligi kelib chiqadi.

### 7.10- misol. Ushbu

$$\frac{4}{25}(e-1) < \int_0^1 \frac{e^x}{(x+2)(3-x)} dx < \frac{1}{6}(e-1)$$

tengsizliklarni isbotlang.

**Yechilishi.**  $f(x) = \frac{1}{(x+2)(3-x)}$  funksiyaning  $[0,1]$  kesmadagi

$$f'(x) = \frac{2x-1}{(x+2)^2(3-x)^2} \text{ hosisasi, } x = \frac{1}{2} \text{ nuqtada nolga teng bo‘ladi.}$$

Funksiyaning hosisasi,  $x = \frac{1}{2}$  nuqtadan o‘tishda, o‘z ishorasini, manfiydan musbatga o‘zgartiradi. Shuning uchun,  $f(x)$  funksiya bu nuqtada minumumga erishadi, ya’ni  $f_{\min}\left(\frac{1}{2}\right) = \frac{4}{25}$ . Funksiya maksimum qiymatiga

$[0,1]$  kesmaning chetki nuqtalarida erishadi, ya’ni  $f_{\max}(0) = f_{\max}(1) = \frac{1}{6}$ .

Shunday qilib,  $\frac{4}{25} \leq \frac{1}{(x+2)(3-x)} \leq \frac{1}{6}, x \neq 0, x \neq \frac{1}{2} \text{ va } x \neq 1$  bo‘lganda esa,

$$\frac{4}{25} \int_0^1 e^x dx < \int_0^1 \frac{e^x}{(x+2)(3-x)} dx < \frac{1}{6} \int_0^1 e^x dx,$$

$$\frac{4}{25}(e-1) < \int_0^1 \frac{e^x}{(x+2)(3-x)} dx < \frac{1}{6}(e-1).$$

Demak, 7.5-misoldagi (7.14) tengsizliklarga asosan,

$$\frac{4}{25} \int_0^1 e^x dx < \int_0^1 \frac{e^x}{(x+2)(3-x)} dx < \frac{1}{6} \int_0^1 e^x dx.$$

Bundan talab qilingan tengsizlik kelib chiqadi.

### 7.11 -misol.

$$\text{Quyidagi: } \int_0^1 \sqrt{1+x^2} dx \text{ va } \int_0^1 x dx$$

integrallarning qaysi biri katta?

**Yechilishi.**  $\sqrt{1+x^2}$  va  $x$  funksiyalar  $[0,1]$  kesmada uzluksiz (integrallanuvchi).  $[0,1]$  kesmada  $x < \sqrt{1+x^2}$  tengsizlik o‘rinli. U holda (aniq integralning 6<sup>0</sup>-xossasiga asosan),

$$\int_0^1 x dx < \int_0^1 \sqrt{1+x^2} dx \text{ t}$$

tengsizlik o‘rinli bo‘ladi.

**7.12-misol.** Agar  $f(x)$  va  $\varphi(x)$  funksiyalar  $[a,b]$  kesmada integrallanuvchi bo'lsa, u holda,

$$\left| \int_a^b f(x)\varphi(x)dx \right| \leq \sqrt{\int_a^b f^2(x)dx \cdot \int_a^b \varphi^2(x)dx} \quad (7.16)$$

tengsizlik o'rini bo'lishini isbotlang. Odatda, bu tengsizlik, Koshi - Bunyakovskiy tengsizligi deb ataladi.

**Yechilishi.**  $[f(x) - \lambda\varphi(x)]^2$  funksiyani qaraymiz. Bunda  $\lambda$  - ixtiyoriy haqiqiy son. Bu funksiya  $[a,b]$  kesmada integrallanuvchi. Aniq integralning  $6^0$ -xossasiga asosan,

$$\int_a^b [f(x) - \lambda\varphi(x)]^2 dx \geq 0$$

yoki

$$\lambda^2 \int_a^b \varphi^2(x)dx - 2\lambda \int_a^b f(x)\varphi(x)dx + \int_a^b f^2(x)dx \geq 0.$$

Bu tengsizlikning chap tomoni  $\lambda$  ga nisbatan kvadrat uchhaddan iborat bo'lib, u  $\lambda$  ning barcha qiymatlarda nomanifiy, demak, kvadrat uchhadning diskriminanti manfiy emas:

$$\int_a^b f^2(x)dx - \int_a^b \varphi^2(x)dx - \left\{ \int_a^b f(x)\varphi(x)dx \right\}^2 \geq 0,$$

bundan (7.16) tengsizlikning o'rini ekanligi kelib chiqadi.

**7.13-misol.** Ushbu

$$\int_0^{\frac{\pi}{2}} x^2 \cdot \sqrt{\cos x} dx \leq \frac{\pi^3}{24}$$

tengsizlikni isbotlang.

**Yechilishi.**  $f(x) = x^2$ ,  $g(x) = \sqrt{\cos x}$  deb olsak, (7.16) formulaga asosan,

$$\int_0^{\frac{\pi}{2}} x^2 \cdot \sqrt{\cos x} dx \leq \sqrt{\int_0^{\frac{\pi}{2}} x^2 dx} \cdot \sqrt{\int_0^{\frac{\pi}{2}} \cos x dx} = \frac{\pi^3}{24}$$

bo'lishi kelib chiqadi.

Agar  $\varphi(x), \psi(x)$  funksiyalar,  $[a,b]$  kesmada differensiallanuvchi bo'lib,  $x \in [a,b]$  uchun,  $A \leq \varphi(x) \leq B$  bo'lsa,  $f(x)$  esa,  $[A, B]$  kesmada uzluksiz bo'lsa, u holda

$$F(x) = \int_{\varphi(x)}^{\psi(x)} f(t)dt; \quad a \leq x \leq b$$

funksiya  $[a,b]$  kesmada differensiallanuvchi bo'ladi va

$$\frac{d}{dx} \int_{\varphi(x)}^{\psi(x)} f(t) dt = f(\psi(x)) \cdot \psi'(x) - f(\varphi(x)) \cdot \varphi'(x) \quad (7.17)$$

formula o'rinli.

### 7.14-misol. Ushbu

$$\frac{d}{dx} \int_x^x \frac{dt}{1+t^4}$$

hosilani hisoblang.

**Yechilishi.** (7.17) formulaga asosan,

$$\frac{d}{dx} \int_x^x \frac{dt}{\sqrt{1+t^4}} = \frac{1}{\sqrt{(1+x^{12})}} \cdot 3x^2 - \frac{1}{\sqrt{1+x^8}} \cdot 2x = \frac{3x^2}{\sqrt{1+x^{12}}} - \frac{2x}{\sqrt{1+x^8}}.$$

### 7.15-misol. Ushbu

$$g_c(x) = \begin{cases} 0, & x \in [a; b], x \neq c, \\ A, & x = c \end{cases}$$

funksiya uchun,

$$\int_a^b g_c(x) dx = 0$$

ekanligini isbotlang.

**Iloboti.**  $[a, b]$  kesmaning,  $P = \{a = x_0 < x_1 < \dots < x_n = b\}$  bo'linishini olamiz. Faraz qilaylik,  $c$  nuqta, qism kesmalarining birida yotsin, misol uchun,  $c \in [x_m, x_{m+1}]$  bo'lsin. Berilgan  $g_c(x)$  funksiyaning  $P$  bo'linishiga mos kelgan integral yig'indisini tuzamiz:  $\xi_k$  deb, qism kesmalarining chap chetki nuqtalarini olamiz:

$$\sigma_P(g_c) = \sum_{k=0}^{n-1} g_c(x) \Delta x_k = g_c(\xi_{m-1}) \Delta x_{m-1} + g_c(\xi_m) \Delta x_m,$$

qolgan yig'indilar nolga teng. Shartga ko'ra,

$$|g_c(x)| \leq |A|$$

bo'lgani uchun,

$$|\sigma_P(g_c)| \leq |A|(\Delta x_{m-1} + \Delta x_m).$$

Bundan,  $\lim_{d(P) \rightarrow 0} \sigma_P(g_c) = 0$ , ya'ni  $\int_a^b g_c(x) dx = 0$  ekanligi kelib chiqadi.

**7.16-misol.** Agar  $f(x)$  funksiya  $[a, b]$  kesmada integrallanuvchi bo'lib, uning qiymatini biror  $c \in [a; b]$  nuqtada o'zgartirsak, natijada, yangi hosil bo'lgan  $f_1(x)$  funksiya ham,  $[a, b]$  kesmada integrallanuvchi bo'lishini va

$$\int_a^b f_1(x) dx = \int_a^b f(x) dx$$

tenglikning o'rinli ekanligini isbotlang.

**Yechilishi.** Shartga ko'ra,

$$f_i(x) = \begin{cases} f(x), & x \in [a; b], x \neq c \text{ bo'lq anda}, \\ f_i(x) \neq f(x), & x = c \text{ bo'lq anda}. \end{cases}$$

Demak,  $f_i(x) = f(x) + g_c(x)$ , bunda,

$$g_c(x) = \begin{cases} 0, & x \in [a; b], x \neq c \text{ bo'lq anda}, \\ A, & x = c \text{ bo'lq anda}. \end{cases}$$

Aniq integralning  $4^0$ -xossasiga, hamda 7.15- misolga asosan,

$$\int_a^b f_i(x) dx = \int_a^b f(x) dx + \int_a^b g_c(x) dx = \int_a^b f(x) dx.$$

**7.2 - eslatma.** 7.15- va 7.16- misollarga asosan, quyidagi xulosani chiqarish mumkin:  $f(x)$  funksiyaning integrallanuvchiligi, uning ba'zi berilgan nuqtalardagi qiymatlariga bog'liq bo'lmaydi.

### Mustaqil yechish uchun misollar

Quyidagi funksiyalarning berilgan kesmada integrallanuvchi ekanligini ko'rsating:

$$7.1. f(x) = \begin{cases} \frac{x \ln x}{1-x}, & 0 < x < 1 \text{ bo'lq anda}, \\ 0, & x = 0 \text{ bo'lq anda}, \\ -1, & x = 1 \text{ bo'lq anda}. \end{cases} \quad 7.2. f(x) = \begin{cases} 1, & 0 \leq x < 1 \text{ bo'lq anda}, \\ 0, & 1 \leq x < 2 \text{ bo'lq anda}, \\ 3, & 2 \leq x \leq 3 \text{ bo'lq anda}. \end{cases}$$

$$7.3. f(x) = \begin{cases} \cos \frac{1}{x}, & 0 < x \leq 1 \text{ bo'lq anda}, \\ 2, & x = 0 \text{ bo'lq anda}. \end{cases} \quad 7.4. f(x) = \begin{cases} \frac{x}{2} + \frac{1}{2}, & 1 \leq x < 2 \text{ bo'lq anda}, \\ x, & 2 \leq x \leq 3 \text{ bo'lq anda}. \end{cases}$$

7.5. Agar  $f(x)$  funksiya  $[a, b]$  kesmada integrallanuvchi bo'lsa, uning shu kesmada chegaralangan ekanligini isbotlang.

7.6.  $f(x)$  funksiyaning  $[a, b]$  kesmada integrallanuvchi bo'lishi uchun,  $\forall \varepsilon > 0$  olinganda ham, shunday  $\delta = \delta(\varepsilon) > 0$  son topilib,  $[a, b]$  kesmaning, diametrлари  $\delta$  dan kichik bo'lgan, har qanday  $P_1$  va  $P_2$  bo'linishlarida

$$|\sigma_{P_1}(f) - \sigma_{P_2}(f)| < \varepsilon$$

tengsizlikning bajarilishi zarur va etarli ekanligini isbotlang.

7.7.  $[a, b]$  kesmada har qanday chegaralangan monoton funksiyaning shu kesmada integrallanuvchi ekanligini isbotlang.

7.8. Agar  $f(x)$  va  $g(x)$  funksiyalar  $[a, b]$  kesmada uzlusiz,  $P = \{x_k\}_{k=0}^{k_p}$  bu kesmaning bo'linishi,  $\xi_i \in [x_{i-1}, x_i]$ ,  $\eta_i \in [x_{i-1}, x_i]$ ,  $\Delta x_i = x_i - x_{i-1}$ ,  $i = 1, 2, \dots, k_p$  bo'lsa, u holda,

$$\lim_{\lambda_p \rightarrow 0} \sum_{i=1}^{k_p} f(\xi_i) g(\eta_i) \Delta x_i = \int_a^b f(x) g(x) dx$$

tenglik o'rini ekanligini isbotlang.

**7.9.** Agar  $f(x)$  funksiya  $[0; 1]$  kesmada monoton bo'lsa,  $[0; 1]$  kesmada

$$\int_0^1 f(x) dx - \frac{1}{n} \sum_{i=1}^n f\left(\frac{k}{n}\right)_i = O\left(\frac{1}{n}\right), \quad n \rightarrow \infty$$

ekanligini isbotlang.

**7.10.** Agar  $f(x)$  funksiya  $[a, b]$  kesmada chegaralangan va qavariqligi yuqoriga qaragan (botiq) bo'lsa, u holda uning shu kesmada integrallanuvchi bo'lishi va

$$(b-a) \frac{f(a)+f(b)}{2} \leq \int_a^b f(x) dx \leq (b-a) f\left(\frac{a+b}{2}\right)$$

tengsizlik o'rini ekanligini isbotlang.

**7.11.** Agar  $f(x)$  funksiya  $[a, b]$  kesmada Riman ma'nosida integrallanuvchi bo'lsa, u holda,

$$\lim_{\lambda_p \rightarrow 0} s_p(f) = \lim_{\lambda_p \rightarrow 0} S_p(f) = \int_a^b f(x) dx$$

tenglik o'rini ekanligini isbotlang.

**7.12.** Agar  $f(x)$  funksiya  $[a, b]$  kesmada integrallanuvchi,  $\forall x \in [a, b]$  lar uchun  $c \leq f(x) \leq d$  bo'lib,  $g(x)$  funksiya  $[c, d]$  kesmada uzlusiz bo'lsa, u holda,  $g(f(x))$  funksiyaning  $[a, b]$  kesmada integrallanuvchi ekanligini isbotlang.

**7.13.** Kvadrati integrallanuvchi bo'lib, o'zi integrallanmaydigan funksiyaga misol tuzing.

**7.14.** Yig'indisi integrallanuvchi bo'lib, qo'shiluvchilarning har biri integrallanmaydigan funksiyalarga misol tuzing.

**7.15.**  $f(x)g(x)$  funksiyaning  $[a, b]$  kesmada integrallanuvchi bo'lishidan,  $f(x)$  va  $g(x)$  funksiyalarning  $[a, b]$  kesmada har doim integrallanuvchi bo'lishi kelib chiqadimi?

**7.16.** Agar  $f(x)$  funksiya  $[a, b]$  kesmada aniqlangan  $(a, b)$  kesmada uzlusiz bo'lsa, u holda  $[a, b]$  kesmada integrallanmaydigan funksiyaga misol tuzing.

Quyidagi integrallarni baholang:

$$7.17. J = \int_0^{\frac{\pi}{2}} \sqrt{1 + \frac{1}{2} \sin^2 x} dx.$$

$$7.18. J = \int_0^{2\pi} \frac{dx}{10 + 3 \cos x}.$$

$$7.19. J = \int_0^1 \frac{dx}{\sqrt{2+x-x^2}}.$$

$$7.21. J = \int_0^1 \frac{x^6}{\sqrt{1+x}} dx.$$

$$7.20. J = \int_0^1 e^{-x^2} dx.$$

$$7.22. J = \int_{\frac{\sqrt{3}}{3}}^{\sqrt{3}} x \operatorname{arctg} x dx.$$

Quyidagi tengsizliklarni isbotlang:

$$7.23. \int_0^{\frac{\pi}{2}} e^{-R \sin x} dx > \frac{\pi}{2R} (1 - e^{-R}) (R > 0). \quad 7.24. 0,5 < \int_0^{0,5} \frac{dx}{\sqrt{1-x^{2n}}} \leq \frac{\pi}{6} (n \geq 1).$$

## 8-§. Aniq integralni hisoblash

Har doim, har qanday integrallanuvchi funksiyaning aniq integralini, integral yig'indining limiti sifatida qarab, hisoblash oson bo'lavermaydi, ya'ni integral yig'indini tuzib, uning limitini hisoblashda ancha noqulayliklar va qiyinchiliklarga duch kelinadi. Shuning uchun, aniq integralni yuqoridagi ta'rif bo'yicha hisoblash usulidan boshqa soddarroq usulini topish zaruriyati tug'iladi. Bu usullarni quyida keltirib o'tamiz.

**8.1. Nyuton-Leybnis formulasi.** Yuqorida ko'rdikki, agar  $f(x)$  funksiya  $[a, b]$  kesmada uzlusiz bo'lsa, u holda u shu kesmada boshlang'ich funksiyalarga ega bo'ladi. Aniq integralning  $11^0$ -xossasiga asosan,

$$\Phi(x) = \int_a^x f(t) dt$$

Funksiya,  $f(x)$  funksiyaning boshlang'ich funksiyalaridan biridir.  $F(x) - f(x)$  funksiyaning  $[a, b]$  kesmadagi ixtiyoriy boshlang'ich funksiyasi bo'lsin. Ma'lumki,  $\Phi(x)$  va  $F(x)$  boshlang'ich funksiyalarning biri, ikkinchisidan o'zgarmas songa farq qiladi, ya'ni

$$\int_a^x f(t) dt = F(x) + C, \quad a \leq x \leq b.$$

Bundan,  $x = a$  deb olib,

$$0 = F(a) + C, \quad C = -F(a)$$

ekanligini topamiz, ya'ni  $\forall x \in [a, b]$  uchun,

$$\int_a^b f(x) dx = F(b) - F(a) \tag{8.1}$$

Nyuton - Leybnis formulasiga ega bo'lamiz. Odatda, (8.1) formula, *integral hisobning asosiy formulasasi*, deb ham yuritiladi.

**8.1-eslatma.** Odatdagidek,

$$F(x)|_a^b = F(x)|_{x=a}^{x=b} = F(b) - F(a)$$

belgilashni olsak, u holda, (8.1) Nyuton - Leybnis formulasini,

$$\int_a^b f(x)dx = F(x)|_a^b$$

ko'rinishda ham yozish mumkin.

**8.1-misol.** Ushbu  $\int_a^b x^m dx, m \neq -1$  integralni Nyuton-Leybnis formulasi orqali hisoblang.

**Yechilishi.** Ma'lumki, integral ostidagi  $f(x)=x^m$  funksiyaning boshlang'ich funksiyasi,  $F(x)=\frac{x^{m+1}}{m+1}$  dan iborat. Nyuton-Leybnis formulasiga asosan,

$$\int_a^b x^m dx = \left. \frac{x^{m+1}}{m+1} \right|_a^b = \frac{b^{m+1} - a^{m+1}}{m+1}, \quad m \neq -1$$

bo'ladi. Xususiy holda,  $m=-1$  bo'lganda,

$$\int_a^b \frac{dx}{x} = \ln|x| |_a^b = \ln|b| - \ln|a| .$$

Shunday qilib, aniq integralni hisoblash masalasi, integral ostidagi integrallanuvchi funksiyaning boshlang'ich funksiyasini topish masalasiga keltirilar ekan. Lekin har qanday integrallanuvchi funksiyaning ham boshlang'ich funksiyasini topish oson bo'lavermaydi. Shuning uchun, aniq integralni hisoblashda, boshqa usullardan ham foydalanishga to'g'ri keladi.

### 8.2. Aniq integrallarda o'zgaruvchilarni almashtirish usuli.

**8.1-teorema.**  $x=g(t)$  funksiya  $[\alpha, \beta]$  kesmada aniqlangan uzluksiz differensiallanuvchi va uning qiymatlari to'plami  $[a, b]$  kesmada iborat bo'lib,  $g(\alpha)=a, g(\beta)=b$  bo'lsin. Agar  $f(x)$  funksiya  $[a, b]$  kesmada uzluksiz bo'lsa, u holda,

$$\int_a^b f(x)dx = \int_{\alpha}^{\beta} f[g(t)]g'(t)dt \tag{8.2}$$

formula o'rinni.

Bu formulaga, aniq integralda o'zgaruvchilarni almashtirish formulasi deyiladi.

### 8.2 -misol. (8.2) formulani isbotlang.

**Yechilishi.**  $f(x)$  funksiya  $[a, b]$  kesmada uzluksiz bo'lgani uchun, 7.5-natijaga asosan,  $f(x)$  funksiya,  $[a, b]$  kesmada,  $\Phi(x)$  boshlang'ich funksiyaga ega bo'ladi. Bu holda,  $F(t)=\Phi[g(t)], (\alpha \leq t \leq \beta)$  murakkab funksiya hosilaga ega:

$$F'(t)=\Phi'[g(t)] \cdot g'(t)=f[g(t)] \cdot g'(t).$$

Bundan, Nyuton - Leybnis formulasiga asosan,

$$\int_a^b f[g(t)]g'(t)dt = \int_a^b F'(t)dt = F(b) - F(a) = \Phi[g(b)] - \Phi[g(a)] = \Phi(b) - \Phi(a) = \int_a^b f(x)dx.$$

### 8.3-misol. Ushbu

$$\int_0^{\frac{\pi}{2}} \sqrt{\frac{1-x}{1+x}} dx$$

integralni hisoblang.

**Yechilishi.**  $x = \cos t$  almashtirishni olamiz. Bu almashtirishning to‘g‘riligini ko‘rsatish uchun, 8.1-teoremaning shartlarini tekshirib ko‘ramiz:  $x = g(t) = \cos t$  funksiya  $R$  da uzliksiz, yangi  $t$  o‘zgaruvchi,  $t \in [\frac{\pi}{4}; \frac{\pi}{2}]$  kesmada o‘zgarganda, eski  $x = g(t)$  o‘zgaruvchi,  $\left[0, \frac{\sqrt{2}}{2}\right]$  kesmada o‘zgaradi, ya’ni  $g\left(\frac{\pi}{4}\right) = \frac{\sqrt{2}}{2}$ ,  $g\left(\frac{\pi}{2}\right) = 0$ ;  $g'(t) = -\sin t$ ,  $[\frac{\pi}{4}; \frac{\pi}{2}]$  kesmada uzliksiz. Demak, 8.1-teoremaning hamma shartlari bajariladi.

Shunday qilib,  $x = \cos t$ ,  $dx = -\sin t dt$ ,  $g\left(\frac{\pi}{2}\right) = 0$ , ya’ni

$$\beta = \frac{\pi}{2}, g\left(\frac{\pi}{4}\right) = \frac{\sqrt{2}}{2}, \alpha = \frac{\pi}{4}, \frac{1-x}{1+x} = \frac{1-\cos t}{1+\cos t} = \operatorname{tg}^2 \frac{t}{2}$$

Bularni e’tiborga olgan holda,

$$\begin{aligned} \int_0^{\frac{\pi}{2}} \sqrt{\frac{1-x}{1+x}} dx &= \int_{\frac{\pi}{4}}^{\frac{\pi}{2}} \operatorname{tg}^2 \frac{t}{2} \cdot (-\sin t) dt = \int_{\frac{\pi}{4}}^{\frac{\pi}{2}} (1 - \cos t) dt = \\ &= [t - \sin t]_{\frac{\pi}{4}}^{\frac{\pi}{2}} = \frac{\pi}{2} - 1 - \frac{\pi}{4} + \frac{\sqrt{2}}{2} = \frac{\pi}{4} - 1 + \frac{\sqrt{2}}{2}. \end{aligned}$$

### 8.4-misol. Ushbu

$$\int_0^{\ln 3} \frac{e^x \sqrt{e^x + 1}}{e^x + 5} dx$$

integralni hisoblang.

**Yechilishi.**  $\sqrt{e^x + 1} = t$  almashtirishni bajaramiz:  $x_1 = 0$  bo‘lganda,  $t_1 = \sqrt{2}$ ,  $x_2 = \ln 3$  bo‘lganda,  $t_2 = 2$ . Demak,  $x$  o‘zgaruvchi,  $[0; \ln 3]$  kesmada o‘zgarganda, yangi  $t$  o‘zgaruvchi  $[\sqrt{2}; 2]$  kesmada o‘zgaradi.  $x = \ln(t^2 - 1)$  funksiya,  $t = \sqrt{e^x + 1}$  funksiyaga teskari,  $[\sqrt{2}; 2]$  kesmada monoton, uzliksiz va  $x'_t = \frac{2t}{t^2 - 1}$ .

Shunday qilib, 8.1-teoremaning hamma shartlari o‘rinli, shuning uchun, (8.2) formulaga asosan,

$$\begin{aligned} \int_0^{\ln} \frac{e^x \sqrt{e^x + 1}}{e^x + 5} dx &= \int_{\sqrt{2}}^{\sqrt{3}} \frac{(t^2 - 1) \cdot t \cdot 2tdt}{(t^2 + 4)(t^2 - 1)} = \int_{\sqrt{2}}^{\sqrt{3}} \frac{2t^2 dt}{t^2 + 4} = \\ &= 2 \int_{\sqrt{2}}^{\sqrt{3}} \left( 1 - \frac{4}{t^2 + 4} \right) dt = 2[t - 2 \operatorname{arctg} \frac{t}{2}]_{\sqrt{2}}^{\sqrt{3}} = 2[2 - 2 \cdot \frac{\sqrt{\pi}}{4} - \sqrt{2} + 2 \operatorname{arctg} \frac{\sqrt{2}}{2}] = \\ &= 4 - \sqrt{\pi} - 2\sqrt{2} + 2 \operatorname{arctg} \frac{\sqrt{2}}{2}. \end{aligned}$$

### 8.3. Bo‘laklab integrallash usuli.

**8.2-teorema.** Agar  $u = u(x)$  va  $v = v(x)$  funksiyalar,  $[a, b]$  kesmada uzliksiz va uzliksiz hosilalarga ega bo‘lib, ularning xosilalari, shu kesmada integrallanuvchi bo‘lsa, u holda,

$$\int_a^b u dv = uv \Big|_a^b - \int_a^b v du \quad (8.3)$$

yoki

$$\int_a^b u(x)v'(x)dx = u(x)v(x) \Big|_a^b - \int_a^b v(x)u'(x)dx$$

formula o‘rinli.

### 8.5 -misol. Ushbu

$$\int_0^{\sqrt{3}} x \operatorname{arctgx} dx$$

integralni hisoblang.

**Yechilishi.** Integral ostidagi funksiyalar, 8.2– teoremaning barcha shartlarini qanoatlantirishiga ishonch hosil qilish qiyin emas.  $u = \operatorname{arctgx}$ ,  $dv = xdx$  deb olib, (8.3) formulaga asosan,

$$\begin{aligned} \int_0^{\sqrt{3}} x \operatorname{arctgx} x dx &= [du = \frac{dx}{1+x^2}, v = \frac{x^2}{2}] = \\ &= \frac{x^2}{2} \operatorname{arctgx} \Big|_0^{\sqrt{3}} - \frac{1}{2} \int_0^{\sqrt{3}} \frac{x^2 dx}{1+x^2} = \frac{\pi}{3} \cdot \frac{3}{2} - \frac{1}{2} (x - \operatorname{arctgx}) \Big|_0^{\sqrt{3}} = \\ &= \frac{\pi}{2} - \frac{1}{2} \left( \sqrt{3} - \frac{\pi}{3} \right) = \frac{\pi}{2} - \frac{\sqrt{3}}{2} + \frac{\pi}{6} = \frac{2\pi}{3} - \frac{\sqrt{3}}{2}. \end{aligned}$$

*Misolni Maple tizimidan foydalanib yechish:*

> int(x\*arctan(x),x=0..sqrt(3));

$$\frac{2\pi}{3} - \frac{\sqrt{3}}{2}.$$

### 8.6 -misol. Ushbu

$$J_{n,\alpha} = \int_0^1 x^\alpha \ln^n x dx, \quad \alpha > 0, n \in N, \quad (8.4)$$

integralni hisoblang.

**Yechilishi.**  $f(x) = x^\alpha \ln^n x$  funksiya  $[0,1]$  kesmada aniqlangan va uzlusiz, hamda  $\lim_{x \rightarrow 0^+} f(x) = 0$ .  $f(x)$  funksiyani qayta aniqlaymiz, ya'ni  $x=0$  da  $f(x)=0$  deb olsak, u holda  $f(x)$  funksiya  $[0,1]$  kesmada uzlusiz bo'ladi, ya'ni u  $[0,1]$  kesmada integrallanuvchi bo'ladi.

Berilgan (8.4) integralni bo'laklab integrallaymiz:

$$\begin{aligned} J_{n,\alpha} &= \int_0^1 x^\alpha \ln^n x dx = [u = \ln^n x, dv = x^\alpha dx, du = n \frac{\ln^{n-1} x}{x} dx, \\ v &= \frac{x^{\alpha+1}}{\alpha+1}] = \frac{1}{\alpha+1} \cdot x^{\alpha+1} \ln^n x \Big|_0^1 - \frac{n}{\alpha+1} \int_0^1 x^\alpha \ln^{n-1} x dx = \\ &= -\frac{n}{\alpha+1} J_{n-1,\alpha}. \end{aligned}$$

Bundan, ketma-ket bo'laklab integrallash natijasida,

$$\begin{aligned} J_{n,\alpha} &= (-1)^n \frac{n!}{(\alpha+1)^n} J_{0,\alpha} = (-1)^n \frac{n!}{(\alpha+1)^n} \int_0^1 x^\alpha dx = \\ &= (-1)^n \frac{n}{(\alpha+1)^{n+1}}. \end{aligned}$$

rekurrent formulani hosil qilamiz.

**8.7 -misol.** Ushbu

$$\int_1^e x^2 \ln x dx,$$

integralni hisoblang.

**Yechilishi.**

$$\begin{aligned} \int_1^e x \ln^2 x dx &= \left| \begin{array}{l} u = \ln^2 x, du = (\ln^2 x)' dx = \frac{2 \ln x}{x} dx \\ dv = x dx, v = \frac{x^2}{2} \end{array} \right| = \frac{x^2}{2} \ln^2 x \Big|_1^e - \int_1^e \frac{x^2}{2} \frac{2 \ln x}{x} dx = \\ &= \frac{e^2}{2} - \int_1^e x \ln x dx \left| \begin{array}{l} u = \ln x, du = (\ln x)' dx = \frac{1}{x} dx \\ dv = x dx, v = \frac{x^2}{2} \end{array} \right| = \frac{e^2}{2} - \frac{x^2}{2} \ln x \Big|_1^e + \int_1^e \frac{x^2}{2} \frac{1}{x} dx = \\ &= \frac{e^2}{2} - \frac{e^2}{2} + \frac{1}{2} \int_1^e x dx = \frac{e^2}{4} - \frac{1}{4}. \end{aligned}$$

*Misolni Maple tizimidan foydalanib yechish:*

> int(x^(ln(x))^2,x=1..exp(1));

$$\frac{1}{4} e^2 - \frac{1}{4}$$

**8.8-misol.** Ushbu

$$\int_{-1}^1 Q_n(x) P_n(x) dx = 0 \quad (8.5)$$

tenglikni isbotlang, bunda,  $P_n(x) = \frac{1}{2^n n!} \frac{d^n[(x^2 - 1)^m]}{dx^n}$  – Lejandr ko‘phadi

( $n = 0, 1, 2, \dots$ ),  $Q_m(x)$  esa, darajasi  $m < n$  bo‘lgan ixtiyoriy ko‘phad.

**Yechilishi.** Ravshanki,  $\frac{d^k[(x^2 - 1)^m]}{dx^k}$  ( $k = 0, 1, 2, \dots$ ) funksiya  $x = -1$  va  $x = 1$

nuqtalarda nulga aylanadi. Berilgan integralni ketma – ket bo‘laklab integrallash natijasida,

$$\begin{aligned} \left( \frac{1}{2^n n!} \right)^{-1} \int_{-1}^1 Q_m(x) P_n(x) dx &= \left[ u = Q_m(x), dv = \frac{d^n[(x^2 - 1)^m]}{dx^{n-1}} \right] = \\ &= Q_m(x) \frac{d^{n-1}[(x^2 - 1)^m]}{dx^{n-1}} \Big|_{-1}^1 - \int_{-1}^1 Q'_m(x) \frac{d^{n-1}[(x^2 - 2)^m]}{dx^{n-1}} dx = \dots = (-1)^m Q_m^{(m)}(x) \int_{-1}^1 \frac{d^{n-1}[(x^2 - 2)^m]}{dx^{n-1}} dx = \\ &= (-1)^m Q_m^{(m)}(x) \frac{d^{n-m-1}[(x^2 - 1)^m]}{dx^{n-m-1}} \Big|_{-1}^1 = 0 \end{aligned}$$

ekanligini keltirib chiqaramiz, chunki  $Q_m^{(m+1)}(x) = 0$ . Bundan (8.5) tenglikning o‘rinli ekanligi kelib chiqadi.

### Mustaqil yechish uchun misollar

Quyidagi integrallarni, Nyuton-Leybnis formulasiga asosan, hisoblang:

8.1.  $\int_0^1 (2x - 3) dx.$

### **III bob. ANIQ INTEGRALNING TADBIQLARI**

#### **9-§. Aniq integral yordamida tekis shaklning yuzini hisoblash**

##### **9.1. Dekart koordinatalar sistemasida berilgan tekis shaklning yuzini hisoblash**

Tekislikda  $xOy$  Dekart koordinatalar sistemasi berilgan bo'lsin.

**9.1-ta'rif.** Tekislikning  $L$  oddiy (karralı nuqtalarga ega bo'lmagan) yopiq egri chiziq bilan chegaralangan qismi- *tekis shakl (figura)* deyiladi. Bunda  $L$  - tekis shaklning *chegarasi* deyiladi.

*O'qlarga nisbatan standart sohalar.*

**9.2-ta'rif.** Koordinatalari,  $[a, b]$  kesmada uzliksiz  $f_1(x)$  va  $f_2(x)$  funksiyalar uchun,  $a \leq x \leq b$ ,  $f_1(x) \leq y \leq f_2(x)$  munosabatlarni qanoatlantiradigan  $M(x, y)$  nuqtalar to'plami  $D - Ox$  o'qqa nisbatan *standart soha* deyiladi.

Ta'rifning *geometrik ma'nosi* shundan iboratki,  $D$  coha chapdan va o'ngdan, mos ravishda,  $x = a$ ,  $y = b$  to'g'ri chiziqlar kesmalari bilan (bu kesmalar nuqtalarga aylanishi ham mumkin) chegaralangan;  $f_2(x)$  funksiyaning grafigi  $D$  cohaning yuqori chegarasidan,  $f_1(x)$  funksiyaning grafigi esa, uning quy'i chegarasidan iborat (9.1-chizma).

**9.3-ta'rif.** Koordinatalari,  $[c, d]$  kesmada uzliksiz  $g_1(y)$  va  $g_2(y)$  funksiyalar uchun,  $c \leq y \leq d$ ,  $g_1(y) \leq x \leq g_2(y)$  munosabatlarni qanoatlantiradigan  $M(x, y)$  nuqtalar to'plami  $D_1 - Oy$  o'qqa nisbatan *standart soha* deyiladi.

Ta'rifning *geometrik ma'nosi* shundan iboratki,  $D_1$  coha yuqoridan va pastdan, mos ravishda,  $y = c$ ,  $y = d$  to'g'ri chiziqlar kesmalari (bu kesmalar nuqtalarga aylanish ham mumkin) bilan, chapdan va o'ngdan mos ravishda  $g_1(x)$  va  $g_2(x)$  funksiyalarning grafiklari bilan chegaralangandir (9.2-chizma).

O'qlarga nisbatan standart sohalarning yuzalarini hisoblash formulalari:

1.  $Ox$  o'qqa nisbatan *standart*  $D = \{(x, y) : a \leq x \leq b, f_1(x) \leq y \leq f_2(x)\}$  cohaning  $S_D$  yuzi

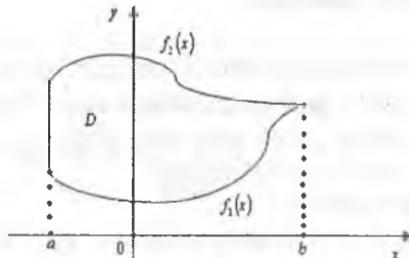

$$S_D = \int_a^b [f_2(x) - f_1(x)] dx$$

formula bo'yicha hisoblanadi.

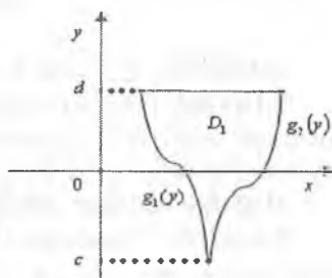

2.Oy o'qqa nisbatan standart  $D_1 = \{(x, y) : c \leq y \leq d, g_1(y) \leq x \leq g_2(y)\}$  cohanning  $S_{D_1}$  yuzi

$$S_{D_1} = \int_c^d [g_2(y) - g_1(y)] dy$$

formula bo'yicha hisoblanadi.

9.1-chizma.

9.2-chizma.

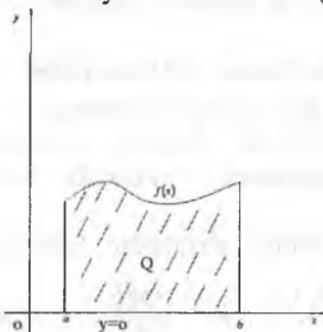

Xususiy holda

3.  $f(x)$  funksiya  $[a; b]$  kesmada aniqlangan va uzlusiz bo'lib,  $\forall x \in [a; b]$  da  $f(x) \geq 0$  bo'lsin.

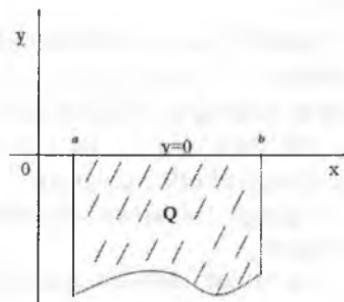

Yuqoridaan  $f(x)$  funksiyaning grafigi, yon tomonlardan  $x=a$  va  $x=b$  to'g'ri chiziqlar, pastdan esa, ox o'q bilan chegaralangan shaklning (odatda bunday shakl, egri chiziqli trapesiya, deb yuritiladi) yuzi,

$$S = \int_a^b f(x) dx \quad (9.1)$$

formula bo'yicha hisoblanadi (9.3-chizma).

9.3-chizma.

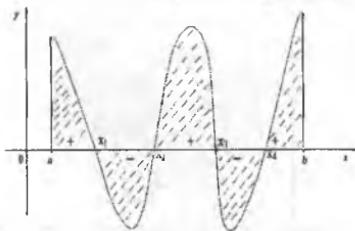

9.4-chizma.

4. Agar  $[a;b]$  kesmada aniqlangan, uzlusiz  $f(x)$  funksiya manfiy, ya'ni  $f(x) < 0$  bo'lsa, u holda, asosi  $[a;b]$  kesmada iborat bo'lib, quyidan  $y = f(x)$  funksiyaning grafigi bilan chegaralangan (9.4 - chizma) trapesiyaning yuzi manfiy bo'ladi:

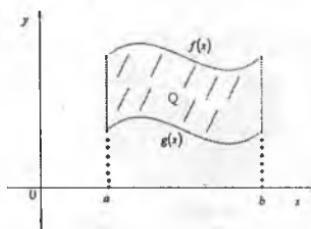

$$S = \left| \int_a^b f(x) dx \right| = - \int_a^b f(x) dx$$

5. Agar  $[a;b]$  kesma, chekli sondagi qism oraliqlarga bo'lingan bo'lib, ularning har birida funksiyaning qiymati manfiy emas ( $f(x) \geq 0$ ) yoki musbat emas ( $f(x) \leq 0$ ) bo'lsa, u holda, (9.1) integral, chekli sondagi,  $ox$  o'qdan yuqorida va undan pastda joylashgan (yuzi manfiy), egor chiziqli sohalar yuzlarining yig'indisiga teng bo'ladi (9.5 - chizma), ya'ni

$$S = \int_a^{x_1} f(x) dx + \left| \int_{x_1}^{x_2} f(x) dx \right| + \int_{x_2}^{x_3} f(x) dx + \left| \int_{x_3}^{x_4} f(x) dx \right| + \dots + \int_{x_n}^b f(x) dx.$$

9.5-chizma.

9.6 -chizma.

6.  $f(x), g(x)$  funksiyalar  $[a;b]$  kesmada aniqlangan uzlusiz,  $f(x) \geq 0, g(x) \geq 0$  va  $\forall x \in [a, b]$  uchun,  $f(x) \geq g(x)$  bo'lsin. U holda,  $y = f(x)$ ,  $y = g(x)$ ,  $x = a$ ,  $x = b$  chiziqlar bilan chegaralangan sohaning yuzi,

$$S = \int_a^b [f(x) - g(x)] dx \quad (9.2)$$

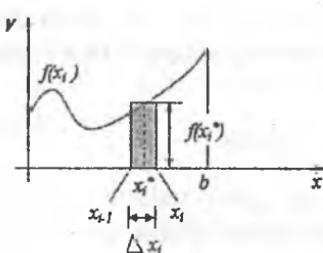

formula orqali topiladi (9.6 - chizma).

**Tasavvur qilinadigan (ifodalovchi) to'g'ri to'rtburchaklar.**

Biz yuqorida ko'rdikki, aniq integral, Riman yig'indisining limiti shaklida, quyidagicha ifodalanadi:

$$\int_a^b f(x) dx = \lim_{n \rightarrow \infty} [f(\xi_1) \Delta x_1 + f(\xi_2) \Delta x_2 + \dots + f(\xi_n) \Delta x_n] \quad (9.3)$$

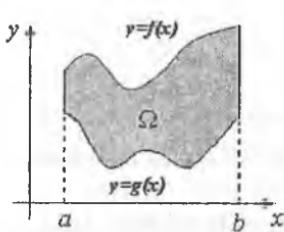

Bunda  $\xi_i$ ,  $[x_{i-1}, x_i]$  oraliqdagi ixtiyoriy tanlangan nuqta,  $f(\xi_i)$  esa,  $f(x)$  funksiyaning shu oraliqda tasavvur qilinadigan qiymatidir. Agar  $f(x)$  funksiya musbat bo'lsa,  $f(\xi_i) \Delta x_i$  ko'paytma, 9.7-chizmada ko'rsatilgan *tasavvur qilinadigan to'g'ri to'rtburchakning* yuzini beradi.

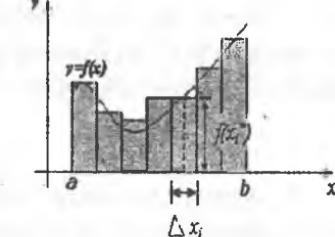

9.7-chizma.

(9.3) formula bizga, berilgan egri chiziqdan pastda joylashgan yuzani, tasavvur qilinadigan to‘g‘ri to‘rtburchaklar yuzalari yig‘indisi sifatida, tasvirlash mumkinligini ko‘rsatadi (9.8-chizma).

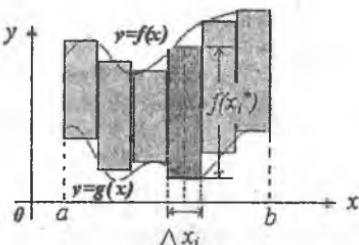

Endi  $\Omega$  soha, yuqorida  $f(x)$  funksiyaning grafigi, pastdan esa,  $g(x)$  funksiyaning grafigi bilan chegaralangan bo‘lsin (9.11 - chizma).

9.9-chizma.

9.8-chizma.

9.10-chizma.

Unda  $\Omega$  sohaning yuzi,  $f(x)-g(x)$  funksiyani,  $x=a$  dan  $x=b$  gacha,  $x$  bo‘yicha integrallasha yordamida topiladi (hisoblanadi), ya’ni

$$S_\Omega = \int_a^b [f(x) - g(x)] dx.$$

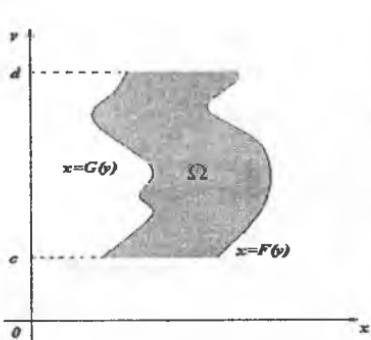

Bu holda Riman yig‘indisi,

$$[f(\xi_1) - g(\xi_1)]\Delta x_1 + [f(\xi_2) - g(\xi_2)]\Delta x_2 + \dots + [f(\xi_n) - g(\xi_n)]\Delta x_n$$

shaklida bo‘ladi va tasavvur qilinadigan to‘g‘ri to‘rtburchaklarning o‘lchamlari quyidagicha:  $f(\xi_i) - g(\xi_i)$  - «balandligi» va  $\Delta x_i$  - «asosi» (9.11-chizma) bo‘ladi.

Endi  $y$  ga nisbatan integrallasha yordamida yuzalarni hisoblash formulasini keltirib chiqaramiz. 9.11-chizmada ko‘rsatilgan  $\Omega$  sohaning

chegaralari,  $x$  ning funksiyalari bo‘lmasdan, ular  $y$  ning funksiyalaridan iborat bo‘lgan holni qaraymiz.

9.11-chizma.

Bu holda tasavvur qilinadigan to‘g‘ri to‘rtburchaklarni gorizontal ko‘rinishda olamiz va yuzani,

$$[F(\eta_1) - G(\eta_1)]\Delta y_1 + [F(\eta_2) - G(\eta_2)]\Delta y_2 + \dots + [F(\eta_n) - G(\eta_n)]\Delta y_n$$

Riman yig‘indisining limiti sifatida, tasvirlaymiz (9.12-chizma).

Demak, berilgan sohaning yuzi,

$$\int_c^d [F(y) - G(y)] dx$$

integral orqali ifodalanadi. Bu yerda integrallash,

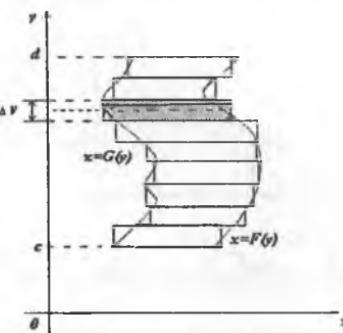

$$F(y) - G(y)$$

«gorizontal bo‘linish» ni  $y$  ga nisbatan bajaradi.

**9.1-misol.**  $x = y^2$  va  $x - y = 2$  chiziqlar bilan chegaralangan sohaning yuzini: a)  $x$  ga nisbatan; b)  $y$  ga nisbatan integrallash yordamida hisoblang.

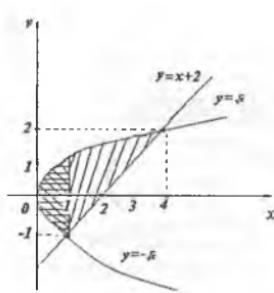

**Yechilishi.** Avvalo, berilgan chiziqlarning (1;-1), (4;2) nuqtalarda kesishishiga ishonch hosil qilish mumkin.

a)  $x$  bo‘yicha integrallash uchun, tasavvur qilinadigan to‘g‘ri to‘rtburchaklarni vertikal joylashtiramiz va tenglamalarni  $y$  ga nisbatan echamiz:  $x = y^2$  tenglamani  $y$  ga nisbatan Yechib,  $y = \pm\sqrt{x}$  bo‘lishini olamiz, bunda  $y = \sqrt{x}$  - parabolaning yuqori yarmidan,  $y = -\sqrt{x}$  esa, parabolaning quyi yarmidan iborat.  $x - y = 2$  to‘g‘ri chiziq tenglama-sini  $y = x - 2$  shaklida yozamiz (9.13- chizma). Qaralayotgan sohaning yuqori chegarasi,  $y = \sqrt{x}$  egri chiziqdandan iborat. Uning quyi chegarasi esa, ikkita, har xil tenglamalar orqali ifodalanadi:  $x = 0$  dan  $x = 1$  gacha

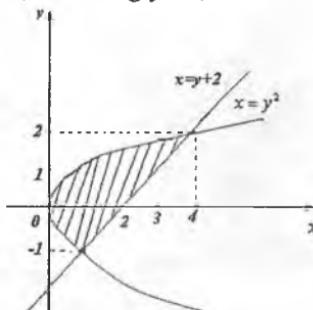

9.12-chizma.

o'zgarganda,  $y = -\sqrt{x}$  egri chiziq,  $x=1$  dan  $x=4$  gacha o'zgarganda esa,  $y = x - 2$  to'g'ri chiziq. Shunday qilib, sohaning yuzi,

9.13-chizma.

9.14-chizma.

$$\begin{aligned} S &= \int_0^1 [\sqrt{x} - (-\sqrt{x})] dx + \int_1^4 [\sqrt{x} - (x - 2)] dx = 2 \int_0^1 \sqrt{x} dx + \int_1^4 [\sqrt{x} - x + 2] dx = \\ &= \left[ \frac{4}{3} x^{3/2} \right]_0^1 + \left[ \frac{2}{3} x^{3/2} - \frac{1}{2} x^2 + 2x \right]_1^4 = \frac{9}{2}. \end{aligned}$$

Y bo'yicha integrallash uchun, biz tasavvur qilinadigan to'g'ri to'rtburchaklarni gorizontal joylashtiramiz (9.14-chizma). Bunda, o'ngdan chegaralovchi to'g'ri chiziq  $x = y + 2$  va chapdan chegaralovchi egri chiziq esa,  $x = y^2$ . Modomiki,  $y = -1$  dan  $2$  gacha o'zgarar ekan,

$$S = \int_{-1}^2 [y + 2 - y^2] dy = \left[ \frac{1}{2} y^2 + 2y - \frac{1}{3} y^3 \right]_{-1}^2 = \frac{9}{2}.$$

**9.2-misol.** Ushbu  $y = 2x$  to'g'ri chiziq va  $y = 3 - x^2$  parabola bilan chegaralangan sohaning yuzini toping.

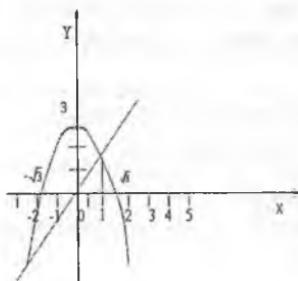

**Yechilishi.** Berilgan to'g'ri chiziq bilan parabolaning kesishish nuqtalarini topamiz:

$$\begin{cases} y = 2x \\ y = 3 - x^2 \end{cases}, 3 - x^2 = 2x, x^2 + 2x - 3 = 0; \quad x_1 = 1, x_2 = -3 .$$

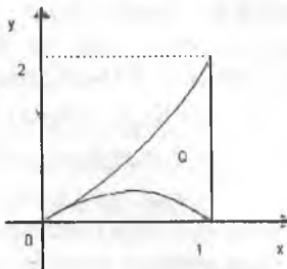

Demak, to'g'ri chiziq bilan parabola  $(1; 2)$  va  $(-3; -6)$  nuqtalarda kesishadi.

Shunday qilib, izlanayotgan sohaning yuzi (9.15-chizma),

$$S = \int_{-3}^1 [3 - x^2 - 2x] dx = \left( 3x - \frac{x^3}{3} - x^2 \right) \Big|_{-3}^1 = \frac{5}{3} - (-9 + 9 - 9) = \frac{5}{3} + 9 = \frac{32}{3} \text{ (kv. bir)}.$$

9.15 chizma.

9.16- chizma.

**9.3-misol.** Ushbu  $(y-x)^2 = x^3$  egri chiziq va  $x=1$  to‘g‘ri chiziq bilan chegaralangan sohaning yuzini toping.

**Yechilishi.** Ravshanki,  $y, x$  ning oshkormas funksiyasi sifatida,  $x \geq 0$  uchun aniqlangan.  $y-x = \pm x\sqrt{x}$  egri chiziqning

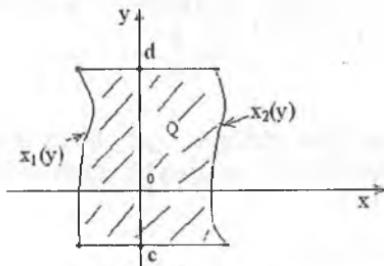

$y_1 = x + x\sqrt{x}$ ,  $y_2 = x - x\sqrt{x}$  shaxobchalaridan birinchisi har doim musbat bo‘lib,  $x \geq 0$  da,  $y_1(x) \geq y_2(x)$  tengsizlikni qanoatlantiradi (9.16 -chizma). (9.2) formulaga asosan,

$$S = \int_0^1 [y_1(x) - y_2(x)] dx = \int_0^1 (x + x\sqrt{x} - x + x\sqrt{x}) dx = 2 \int_0^1 x\sqrt{x} dx = \frac{4}{5}\sqrt{x^5} \Big|_0^1 = \frac{4}{5} (\text{kv. bir.})$$

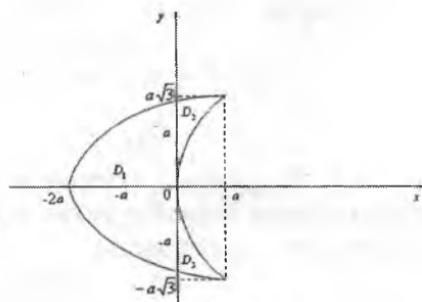

Agar  $(s)$ - soha, ushbu  $(s) = \{(x, y) : c \leq y \leq d, x_1(y) \leq x \leq x_2(y)\}$  ko‘rinishda bo‘lsa (9.17- chizma), u holda uning  $S$  yuzi, quyidagi ,

$$S = \int_c^d [x_2(y) - x_1(y)] dy \quad (9.3)$$

formula orqali topiladi.

9.17- chizma.

9.18-chizma

**9.4-misol.** Ushbu  $x^2 + 2ax - y^2 = 0$ ,  $ax - y^2 + 2a^2 = 0$ , ( $a > 0$ ) egri chiziqlar bilan chegaralangan sohaning yuzini toping.

**Yechilishi.** Qaralayotgan  $D$  soha,  $Ox$  o'qqa nisbatan standart bo'lmanligi uchun, uni,  $Ox$  o'qqa nisbatan standart bo'lgan uchta sohalarga ajratamiz (9.18-chizma) :

$$D_1 = \{(x, y) : -2a \leq x < 0, -\sqrt{2a^2 + ax} \leq y \leq \sqrt{2a^2 + ax}\},$$

$$D_2 = \{(x, y) : 0 \leq x \leq a, \sqrt{x^2 + 2ax} \leq y \leq \sqrt{2a^2 + ax}\},$$

$$D_3 = \{(x, y) : 0 \leq x \leq a, -\sqrt{2a^2 + ax} \leq y \leq -\sqrt{x^2 + 2ax}\}.$$

$D$ - soha  $Ox$  o'qqa nisbatan simmetrik bo'lganligi uchun, uning  $s$  yuzi  $Ox$  o'qqa nisbatan standart bo'lgan

$\overline{D}_1 = \{(x, y) : -2a \leq x < 0, 0 \leq y \leq \sqrt{2a^2 + ax}\}$  va  $D_2$  sohalar yuzlarining ikkilanganiga teng:

$$\begin{aligned} S &= 2 \left[ \int_{-2a}^0 \sqrt{2a^2 + ax} dx + \int_0^a \left( \sqrt{2a^2 + ax} - \sqrt{x^2 + 2ax} \right) dx \right] = \\ &= 2 \left[ \int_{-2a}^0 \sqrt{2a^2 + ax} dx - \int_0^a \sqrt{x^2 + ax} dx \right] = 2 \left[ \int_{-2a}^0 \sqrt{2a^2 + ax} dx - \int_0^a \sqrt{(x+a)^2 - a^2} dx \right] = \\ &= 2 \left[ \frac{2}{3a} \sqrt{(ax+2a^2)^3} \left[ \frac{(x+a)}{2} \sqrt{x^2 + 2ax} \right]_0^a + \frac{a^2}{2} \ln \left( x+a + \sqrt{x^2 + 2ax} \right) \right] = \\ &= 2a^2 \sqrt{3} + a^2 \ln(2 + \sqrt{3}) \end{aligned}$$

Berilgan soha  $Oy$  o'qqa nisbatan standart sohadan iborat:

$$D = \{(x, y) : -a\sqrt{3} \leq y \leq a\sqrt{3}, \frac{y^2 - 2a^2}{a} \leq x \leq -a + \sqrt{y^2 + a^2}\}$$

Bu  $D$  sohaning simmetrikligidan yana foydalansak, quyidagiga ega bo'lamiciz:

$$\begin{aligned} S &= 2 \int_0^{a\sqrt{3}} \left( \sqrt{y^2 + a^2} - a - \frac{y^2}{a} + 2a \right) dy = \\ &= 2a^2 \sqrt{3} + \left( y\sqrt{y^2 + a^2} + a^2 \ln \left| y + \sqrt{y^2 + a^2} \right| - \frac{2y^3}{3a} \right) \Big|_0^{a\sqrt{3}} = \\ &= 2a^2 \sqrt{3} + a^2 \ln(2 + \sqrt{3}) \end{aligned}$$

**9.2. Tenglamasi parametrik shaklda berilgan egri chiziq bilan chegaralangan sohaning yuzini hisoblash.** Faraz qilaylik, tekislikdag'i shaklini o'rab turuvchi chiziq,

$$\begin{cases} x = x(t) \\ y = y(t) \end{cases} \quad (\alpha \leq t \leq \beta)$$

parametrik tenglamasi bilan berilgan bo'lisin.

1) Agar  $x = x(t)$ ,  $y = y(t)$  funksiyalar  $[\alpha, \beta]$  da uzlusiz,  $\forall t \in [\alpha, \beta]$  da  $x(t) \geq 0$ ,  $y(t) \geq 0$  va  $x(t)$  funksiya uzlusiz manfiy bo'lmanган  $x'(t)$  hosilaga ega bo'lsa, u holda izlanayotgan sohaning yuzi

$$S = \int_{\alpha}^{\beta} y(t) \cdot x'(t) dt \quad (9.4)$$

formula bo'yicha topiladi.

2)  $x = x(t)$ ,  $y = y(t)$  funksiyalar  $[\alpha, \beta]$  da uzluksiz,  $\forall t \in [\alpha, \beta]$  da  $x(t) \geq 0$ ,  $y(t) \geq 0$  va  $y(t)$  funksiya, uzluksiz, manfiy bo'limgan  $y'(t)$  hosilaga ega bo'lsa, u holda, izlanayotgan sohaning yuzi,

$$S = \int_{\alpha}^{\beta} x(t) \cdot y'(t) dt \quad (9.5)$$

formula orqali topiladi.

**9.5-misol.** Ushbu  $\begin{cases} x = a(t - \sin t), \\ y = a(1 - \cos t) \end{cases} \quad (0 \leq t \leq 2\pi)$  egri chiziq va ox o'q bilan chegaralangan sohaning yuzini toping.

**Yechilishi.** Sikloidaning bir arkasi,  $t$  ning, 0 dan  $2\pi$  gacha o'zgarishi natijasida chiziladi, chunki  $y(0) = y(2\pi) = 0$ ,  $t$  ning qolgan qiymatlarida,  $y > 0$ ,  $x(0) = 0$  va  $x(2\pi) = 2\pi a$ .

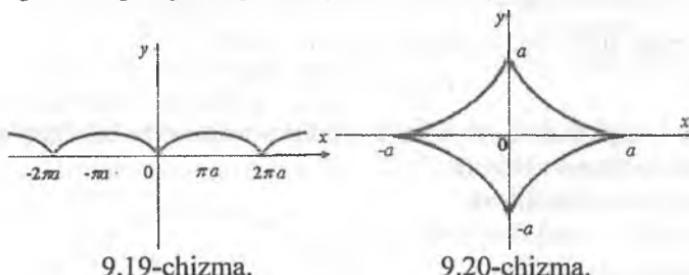

Shunday qilib, izlanayotgan sohaning yuzi,

$$S = \int_0^{2\pi a} y dx$$

formula orqali topiladi. Bunda,  $x = a(t - \sin t)$ ,  $y = a(1 - \cos t)$ ,  $dx = a(1 - \cos t)dt$  ekanligini e'tiborga olsak, u holda  $(x, [0; 2\pi a])$  oraliqda o'zgarganda,  $t, [0; 2\pi]$  oraliqda o'zgaradi,

$$S = a \int_0^{2\pi} (1 - \cos t) \cdot a(1 - \cos t) dt = a^2 \int_0^{2\pi} (1 - \cos t)^2 dt = 3\pi a^2 (\text{kv. bir.}).$$

Demak, izlanayotgan yuza, radiusi  $a$  ga teng bo'lgan doira yuzining uchlanganiga teng ekan (9.19 - chizma).

**9.6-misol.** Ushbu  $\left(\frac{x}{a}\right)^{2/3} + \left(\frac{y}{b}\right)^{2/3} = 1$  egri chiziq bilan chegaralangan sohaning yuzini toping.

**Yechilishi.** Ravshanki, egri chiziq  $ox$  va  $oy$  o'qlarga nisbatan simmetrik (9.20- chizma) bo'ladi. Shuning uchun, egri chiziqli  $OAB$  uchburchakning yuzini topib, uni 4 ga ko'paytirsak, izlanayotgan sohaning yuzi topilgan bo'ladi.

Egri chiziqning tenglamasini, parametrik,

$x = a \sin^3 t$ ,  $y = b \cos^3 t$  ( $0 \leq t \leq 2\pi$ ) shaklda tasvirlaymiz. Bunda,

$$x(0) = 0, \quad x\left(\frac{\pi}{2}\right) = a, \quad [0; \frac{\pi}{2}] \text{ oraliqqa egri chiziqning } AB \text{ yoyi to'g'ri keladi.}$$

Egri chiziqli  $S_{OAB}$  uchburchakning yuzini, (9.4) formula orqali, hisoblaymiz:

$$S_{OAB} = \int_0^{\frac{\pi}{2}} y(t)x'(t)dt. \quad (*)$$

Bu yuzani hisoblashni soddalashtirish maqsadida, oxirgi integralni bo'laklab integrallaymiz:

$$\int_0^{\frac{\pi}{2}} y(t)x'(t)dt = y(t)x(t)\Big|_0^{\frac{\pi}{2}} - \int_0^{\frac{\pi}{2}} x(t)y'(t)dt = - \int_0^{\frac{\pi}{2}} x(t)y'(t)dt \quad (**)$$

(\*) bilan (\*\*) ni qo'shamiz:

$$S_{OAB} = \frac{1}{2} \int_0^{\frac{\pi}{2}} [y(t)x'(t) - x(t)y'(t)]dt \quad (***)$$

Unda, (\*\*\*)) formulaga asosan,

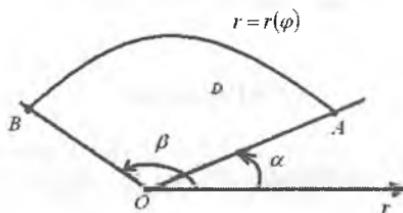

$$\begin{aligned} S_{OAB} &= \frac{1}{2} \int_0^{\frac{\pi}{2}} [\cos^4 t \sin^2 t + \sin^4 t \cdot \cos^2 t] dt = \frac{3ab}{2} \int_0^{\frac{\pi}{2}} \sin^2 t \cos^2 t dt = \\ &= \frac{3ab}{8} \int_0^{\frac{\pi}{2}} \sin^2 2t dt = \frac{3ab}{8} \cdot \int_0^{\frac{\pi}{2}} (1 - \cos 4t) dt = \frac{3\pi ab}{32} \end{aligned}$$

Shunday qilib, izlanayotgan sohaning yuzi,

$$S = 4 \cdot S_{OAB} = 4 \cdot \frac{3\pi ab}{32} = \frac{3\pi ab}{8}.$$

### 9.3. Tenglamasi qutb koordinatalar sistemasida berilgan egri chiziq bilan chegaralangan sohaning yuzini hisoblash.

Faraz qilaylik,  $r = r(\phi)$  funksiya  $[\alpha; \beta]$  oraliqda aniqlangan ( $0 < \beta - \alpha \leq 2\pi$ ), uzlucksiz va  $\forall \phi \in [\alpha; \beta]$  da  $r(\phi) \geq 0$  bo'lsin. U holda,  $r = r(\phi)$  funksiyaning grafigi hamda  $\vec{OA}$  va  $\vec{OB}$  radius

9.21-chizma.

vektorlar bilan chegaralangan soha – egri chiziqli sektorni qaraymiz (9.21- chizma).

Qaralayotgan sektorning yuzi,

$$S = \frac{1}{2} \int_{\alpha}^{\beta} r^2(\varphi) d\varphi$$

formula bo‘yicha hisoblanadi.

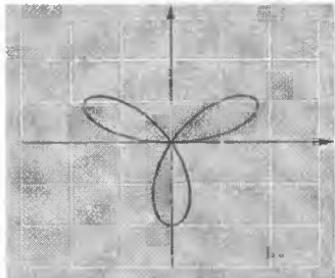

**9.7-misol.** Ushbu  $r = a \sin 3\varphi$ ,  $a > 0$ , egri chiziq bilan chegaralangan sohaning yuzini toping.

**Yechilishi.** Berilgan egri chiziq, har biri egri chiziqli sektordan iborat bo‘lgan sohani (9.22-chizma) chegaralaydi. Ulardan birinchisini, ya’ni  $\{ (r, \varphi) : 0 \leq \varphi \leq \frac{\pi}{3}, 0 \leq r \leq a \sin 3\varphi \}$  sektorni qaraymiz, uning yuzi, (9.6) formula yordamida hisoblanadi:

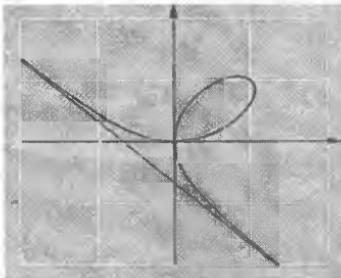

$$S_1 = \frac{1}{2} \int_{0}^{\frac{\pi}{3}} a^2 \sin^2 3\varphi d\varphi = \frac{\pi a^2}{12}.$$

Shunday qilib, izlanayotgan sohaning yuzi,  $S = \frac{3}{12} \cdot \pi a^2 = \frac{\pi a^2}{4}$  (kv.

bir.)

9.22-chizma.

9.23-chizma.

**9.8-misol.** Ushbu  $x^3 + y^3 = 3axy$  egri chiziq bilan chegaralangan sohaning yuzini hisoblang.

**Yechilishi.** Berilgan egri chiziqning qutb koordinatalar sistemasi dagi tenglamasi quyidagicha bo‘ladi:  $\rho (\sin^3 \varphi + \cos^3 \varphi) = 3a \cos \varphi \sin \varphi$ . Bundan,

$$\rho = \frac{3a \cos \varphi \sin \varphi}{\sin^3 \varphi + \cos^3 \varphi}.$$

$[0; \frac{\pi}{2}]$  oraliqning ichida, tenglikning o‘ng tomoni musbat, oraliqning chetki nuqtalarida, ya’ni  $\varphi = 0$  va  $\varphi = \frac{\pi}{2}$  da  $\rho = 0$  bo‘ladi. U holda,  $0 \leq \varphi \leq \frac{\pi}{2}$

segment halqaga akslantiriladi (9.23- chizma). Halqaning yuzini, ushbu

$$S = \frac{1}{2} \int_0^{\frac{\pi}{2}} \rho^2 d\varphi$$

formula bo'yicha hisoblaymiz:

$$S = \frac{1}{2} \int_0^{\frac{\pi}{2}} \rho^2 d\varphi = \frac{9a^2}{2} \int_0^{\frac{\pi}{2}} \frac{\cos^2 \varphi \sin^2 \varphi}{(\sin^3 \varphi + \cos^3 \varphi)^2} d\varphi.$$

$\int \frac{\cos^2 \varphi \sin^2 \varphi}{(\sin^3 \varphi + \cos^3 \varphi)^2} d\varphi$  aniqmas integralda,  $z = \operatorname{tg} \varphi$  almashtirishni olib,

uning boshlang'ich funksiyasini topamiz:

$$\begin{aligned} \int \frac{\cos^2 \varphi \sin^2 \varphi}{(\sin^3 \varphi + \cos^3 \varphi)^2} d\varphi &= \int \frac{\operatorname{tg}^2 \varphi}{(1 + \operatorname{tg}^3 \varphi)^2} \cdot \frac{d\varphi}{\cos^2 \varphi} = \\ &= \int \frac{z^2 dz}{(1 + z^3)^2} = -\frac{1}{3(1 + z^3)} + C = \frac{-\cos^3 \varphi}{3(\sin^3 \varphi + \cos^3 \varphi)} + C. \end{aligned}$$

Bundan,

$$S = \frac{9a^2}{2} \left[ -\frac{\cos^3 \varphi}{3(\sin^3 \varphi + \cos^3 \varphi)} \right]_0^{\frac{\pi}{2}} = \frac{3a^2}{2}.$$

### Mustaqil yechish uchun misollar

Quyidagi chiziqlar bilan chegaralangan sohaning yuzini toping:

$$9.1. y = x, y = 2 - x^2. \quad 9.2. (y - x)^2 = x^3, x = 1. \quad 9.3. y^2 = ax, x^2 = ay.$$

$$9.4. y = 6x - x^2 - 7, y = x - 3. \quad 9.5. y = \sin x, y = 0, 0 \leq x \leq \pi.$$

$$9.6. y = x^2 + 1, x + y = 3. \quad 9.7. y^2 = 2x + 1, x - y - 1 = 0. \quad 9.8. y = 2 - x^2, y^2 = x^3.$$

$$9.9. y = \frac{1}{x}, y = 0, x = a, x = b, a > b > 0. \quad 9.10. y = e^{-x}, x = 0, y = 0, x = a.$$

Quyidagi chiziqlar bilan chegaralangan sohaning yuzini toping:

$$9.11. y = x - \frac{\pi}{2}, y = \cos x, x = 0. \quad 9.12. y = \sin x, y = \cos x, 0 \leq x \leq \frac{\pi}{4}.$$

$$9.13. y = 2^x, y = 2, x = 0.$$

$$9.14. y = (x + 1)^2, x = \sin \pi y, y = 0 (0 \leq y \leq 1).$$

$$9.15. \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1.$$

$$9.16. y = a^x, y = a, x = 0, a > 1.$$

$$9.17. y = |\log_a x|, y = 0, x = 1/a, x = a, a > 1.$$

$$9.18. y = \operatorname{tg} x, y = \frac{2}{3} \cos x, x = 0. \quad 9.19. y = -x^2, y = x^2 - 2x - 4$$

**9.20-9.26** misollardagi chiziqlar orqali berilgan sohani chizing.  
So'ngra sohaning yuzini: a)  $x$  bo'yicha ; b)  $y$  bo'yicha integral sifatida tasvirlang:

$$9.20. y = x^2, y = x + 2 \quad (x = \sqrt{y}, x = y - 2).$$

$$9.21. y = x^3, y = 2x^2 \quad \left( x = \sqrt[3]{y}, x = \frac{1}{\sqrt{2}}\sqrt{y} \right).$$

$$9.22. y = -\sqrt{x}; y = x - 6 \quad (x = y^2, x = y + 6)$$

$$9.23. y = |x|, 3y - x = 8 \quad (x = y, y \geq 0, x = 3y - 8)$$

$$9.24. x + 4 = y^2, x = 5.$$

$$9.25. y = 2x, x + y = 9, y = x - 1 \quad \left( x = \frac{y}{2}, x = 9 - y, x = y + 1 \right)$$

$$9.26. y = x^{1/3}, y = x^2 + x - 17.$$

**9.27- 9.32** misollarda berilgan chiziqlar bilan chegaralangan sohani chizing va uning yuzini hisoblang.

$$9.27. 4x = 4y - y^2, 4x - y = 0.$$

$$9.28. x = y^2, x = 3 - 2y^2$$

$$9.29. x + y - y^3 = 0, x - y + y^2 = 0.$$

$$9.30. y = \cos x, y = \sec^2 x, x \in [-\frac{\pi}{4}, \frac{\pi}{4}]$$

$$9.31. y = \cos x, y = \sin 2x, x \in [-\pi, \pi]. \quad 9.32. y = \sin^4 x \cos x, x \in [0, \pi/2].$$

**9.33.** Berilgan  $(0, 0), (1, 3), (3, 1)$  nuqtalardan o'tuvchi uchburchakning yuzini, integrallash amalini bajarib, hisoblang.

**9.34.** Uchlari,  $(-2, 2), (1, 1), (5, 1), (7, 2)$  nuqtalarda yotgan trapesianying yuzini, integrallash amalini bajarib, hisoblang.

**9.35.**  $y = 6 - x^2, y = x (x < 0)$  va  $y = -x (x > 0)$  chiziqlar bilan chegaralangan sohani chizing va uning yuzini hisoblang.

**9.36.**  $y = x^2$  va  $y = 4$  chiziqlar bilan chegaralangan sohani chizing. Bu soha,  $y = c$  chiziq orqali, ikkita, teng yuzali, qism sohalarga bo'lingan bo'lsa,  $c$  ni toping.

Quyidagi misollarda, qiymati berilgan sohaning yuziga teng bo'lgan, integralni yozing:

**9.37** Soha,  $Ox$  o'q,  $y = \sqrt{3}x$  to'g'ri chiziq va  $x^2 + y^2 = 4$  aylana bilan chegaralangan bo'lib, birinchi chorakda yotadi.

**9.38.** Soha,  $x^2 + y^2 = 4$  va  $(x - 2)^2 + (y - 2)^2 = 4$  aylanalarning kesishishi natijasida hosil qilingan.

**9.39.** To'g'ri to'rtburchakning bir uchi, koordinatalar boshida, qarama-qarshi uchi esa,  $y = bx^n$  chiziqning  $x = a$  bo'lgan ( $a > 0, b > 0, n > 0$ ) nuqtasida, uning tomonlari esa, koordinatalar o'qlariga parallel. U holda, to'g'ri to'rtburchakning  $y = bx^n$  chiziqdan pastda

joylashgan qismi yuzining, to‘g‘ri to‘rtburchakning to‘la yuziga nisbati, faqat  $n$  ga bog‘liq bo‘lishini, ya’ni nisbat  $a$  va  $b$  larga bog‘liq bo‘lmasligini ko‘rsating.

**9.40-9.49** misollarda berilgan chiziqlar bilan chegaralangan sohaning yuzini hisoblang:

$$9.40. \quad y = 6x^2 - 5x + 1, \quad y = \cos \pi x, \quad 0 \leq x \leq 0,5. \quad 9.41. \quad y = \sin 2x, \quad y = \sin x.$$

$$9.42. \quad y = \operatorname{arctg} \sqrt{x}, \quad y + x^2 = 0, \quad x = 1. \quad 9.43. \quad y = 2x^2 e^x, \quad y = -x^3 e^x.$$

$$9.44. \quad 2y = x^2, \quad x^2 + y^2 = 4y, \quad 2y \geq x^2. \quad 9.45. \quad y^2 + x = 4, \quad y^2 - 3x = 12.$$

$$9.46. \quad y = \sqrt{x}, \quad y = x - 2, \quad x = 0.$$

$$9.47. \quad y = \arcsin x, \quad y = \arccos x, \quad y = 0.$$

$$9.48. \quad y = x^2, \quad y = x^2 + x - 1, \quad y = \frac{5x}{2}, \quad y \leq x^2. \quad 9.49. \quad \frac{x^2}{4} + \frac{y^2}{9} = 1, \quad y = \frac{9}{32}x^2, \quad y \leq \frac{9}{32}x^2.$$

**9.50.**  $y^2 = 2x$  parabola  $x^2 + y^2 = 8$  aylana bilan chegaralangan doiraning yuzini qanday nisbatta bo‘ladi?

**9.51.**  $x^2 + y^2 = a^2$  aylana,  $x^2 - 2y^2 = \frac{a^2}{4}$  giperbola yordamida uchta qismga bo‘lingan. Shu qismlarning yuzlarini toping.

**9.52.**  $y = x^2 - 2x + 2$  parabola, unga  $M(3; 5)$  nuqtada o‘tkazilgan urinma va ordinatalar o‘qi bilan chegaralangan sohaning yuzini toping.

**9.53**  $y = -x^2 + 4x - 3$  parabola va unga  $M_1(0; -3)$ ,  $M_2(3; 0)$  nuqtalarda o‘tkazilgan urinmalar bilan chegaralangan sohaning yuzini toping.

**9.54.**  $y = x^2 + 4x + 9$  parabola va unga abssissalari  $x_1 = -3$ ,  $x_2 = 0$  bo‘lgan nuqtalarda o‘tkazilgan urinmalar bilan chegaralangan sohaning yuzini toping.

Quyidagi, tenglamasi parametrik shaklda berilgan, chiziqlar bilan chegaralangan sohaning yuzini toping:

$$9.55. \quad x = a(t - \sin t), \quad y = a(1 - \cos t) \quad (0 \leq t \leq 2\pi), \quad y = 0.$$

$$9.56. \quad x = a \cos^3 t, \quad y = a \sin^3 t.$$

$$9.57. \quad x = at - t^2, \quad x = at^2 - t^3, \quad a > 0. \quad 9.58. \quad x = 1 + t - t^3, \quad y = 1 - 15t^2.$$

$$9.59. \quad x = at - bs \sin t, \quad y = a - b \cos t \quad (0 < b < a) \quad \text{troxoidaning bir tarmog‘i.}$$

**9.60.**  $x = a \cos t(1 - \cos t)$ ,  $y = a \sin t(1 - \cos t)$  kardoidaning ichida yotgan sohaning yuzini toping:

$$9.61. \quad x = a \sin 2t, \quad y = a \sin t, \quad a > 0.$$

$$9.62. \quad x = a \left( \frac{2}{\pi}t - \sin t \right), \quad y = a(1 - \cos t), \quad a > 0.$$

$$9.63. \quad x = a(1 + 2 \cos t), \quad y = a(t \sin t + 2 \sin t), \quad a > 0.$$

Quyidagi tenglamalari qutb koordinatalar sistemasida berilgan, chiziqlar bilan chegaralangan sohaning yuzini toping:

$$9.64. \quad r^2 = a^2 \cos 4\phi \quad (\text{lemniskata}). \quad 9.65. \quad r = a(1 + \cos \phi) \quad (\text{kardoida}).$$

**9.66.**  $r\varphi = a$  (giperbolik spiral)  $\varphi_1 \leq \varphi \leq \varphi_2$ ,  $\varphi_2 - \varphi_1 \leq 2\pi$ .

**9.67.**  $r = \frac{a}{2\pi}\varphi$  (Arximed spirali)  $\varphi_1 \leq \varphi \leq \varphi_2$ ,  $\varphi_2 - \varphi_1 \leq 2\pi$ .

**9.68.**  $r = Re^{k\varphi}$ ,  $k > 0$  (logarifmik spiral)  $\varphi_1 \leq \varphi \leq \varphi_2$ ,  $\varphi_2 - \varphi_1 \leq 2\pi$ .

**9.69.**  $r = 2\sqrt{3}a \cos \varphi$ ,  $\rho = 2a \sin \varphi$ .

**9.70.**  $r = 2 - \cos \varphi$ ,  $\rho = \cos \varphi$ .

**9.71.**  $r = \frac{p}{1 - \cos \varphi} \left( \frac{\pi}{4} \leq \varphi \leq \frac{\pi}{2} \right)$  (parabola).

**9.72.**  $r = \frac{p}{1 + \varepsilon \cos \varphi} \left( \frac{\pi}{4} \leq \varphi \leq \frac{\pi}{2} \right)$

**9.73.**  $r = a \frac{\cos \varphi \sin \varphi}{\cos^3 \varphi + \sin^3 \varphi} \left( 0 \leq \varphi \leq \frac{\pi}{2} \right)$ .

**9.74.**  $r = a(1 - \cos \varphi)$ ,  $r = a$ .

**9.75.**  $r^2 = a^2(1 - 2 \cos \varphi)$ ,  $r = a$ ,  $r \leq a$ .

**9.76.**  $r = a\sqrt{\cos 2\varphi}$  chiziq bilan chegaralangan va  $r = \frac{a}{\sqrt{2}}$

doiraning ichida yotgan sohaning yuzini toping.

**9.77.**  $r = a(1 + \cos \varphi)$  chiziq bilan chegaralangan va  $r = 3a \cos \varphi$  chiziqning tashqarisida joylashgan sohaning yuzini toping.

## 10-§. Aniq integral yordamida chiziqning yoyi uzunligini hisoblash

**10.1. Dekart koordinatalar sistemasida berilgan chiziqning yoyi uzunligini hisoblash.** Faraz qilaylik,  $\vec{AB}$  yoy, fazoda  $x = x(t)$ ,  $y = y(t)$ ,  $z = z(t)$ ,  $t \in [\alpha, \beta]$ , tenglamalar sistemasi orqali aniqlangan bo'lsin. Bunda,  $x(t), y(t), z(t)$  funksiyalar,  $[\alpha; \beta]$  kesmada uzlusiz differensiallanuvchi funksiyalardir. Bu holda,  $\vec{AB}$  yoyning uzunligi,

$$l = \int_a^b \sqrt{(x'(t))^2 + (y'(t))^2 + (z'(t))^2} dt \quad (10.1)$$

formula bo'yicha hisoblanadi.

$\tilde{A}B$  yoy tekislikda berilganda, uning uzunligi,

$$l = \int_a^b \sqrt{(x'(t))^2 + (y'(t))^2} dt \quad (10.2)$$

formula orqali hisoblanadi.

Agar egri chiziqning ( $\tilde{A}B$ -yoyning) tenglamasi oshkor, ya'ni  $y = f(x)$ ,  $x \in [a, b]$  ko'rinishda berilsa, ( $f(x)$ -uzluksiz differensiallanuvchi), uning yoy uzunligi,

$$l = \int_a^b \sqrt{1 + [f'(x)]^2} dx \quad (10.3)$$

formula orqali topiladi.

**10.1-misol.** Ushbu  $y = \frac{4}{5}x^{5/4}$ ,  $0 \leq x \leq 9$  egri chiziqning yoy uzunligini toping.

**Yechilishi.** Berilgan egri chiziqning yoy uzunligini, (10.3) formuladan foydalaniib, topamiz:

$$y'_x = \frac{4}{5} \cdot \frac{5}{4} \cdot x^{\frac{1}{4}} = x^{\frac{1}{4}}, S = \int_0^9 \sqrt{1 + (y'_x)^2} dx = \int_0^9 \sqrt{1 + x^{\frac{1}{2}}} dx.$$

Oxirgi integralda,  $\sqrt{1 + \sqrt{x}} = t$  almashtirishni bajarib,

$$l = 4 \int_1^2 t^2 (t^2 - 1) dt = \frac{232}{15}$$

ekanligini topamiz.

**10.2-misol.** Ushbu  $x = a(t - \sin t)$ ,  $y = a(1 - \cos t)$ ,  $0 \leq t \leq 2\pi$ , egri chiziqning yoy uzunligini toping.

**Yechilishi.** Berilgan egri chiziqning yoy uzunligini, (10.2) formula orqali topamiz:

$$x'_t = a(1 - \cos t), y'_t = a \sin t, \sqrt{(x'_t)^2 + (y'_t)^2} = 2a \sin \frac{t}{2} dt,$$

$$l = \int_0^{2\pi} 2a \sin \frac{t}{2} dt = -4a \cos \frac{t}{2} \Big|_0^{2\pi} = 8a.$$

**10.3- misol.** Ushbu  $x = a(1 - \sin t)$ ,  $y = a(t - \cos t)$ ,  $z = 4a \sin \frac{t}{2}$ ,  $0 \leq t \leq t_0$ , egri chiziqning yoy uzunligini toping.

**Yechilishi.** Berilgan egri chiziqning yoy uzunligini, (10.1) formula orqali topamiz:

$$x'_t = -a \sin t, y'_t = a(1 - \cos t), z'_t = 2a \cos \frac{t}{2}, (x'_t)^2 + (y'_t)^2 + (z'_t)^2 =$$

$$=(-a \sin t)^2 + (a(1-\cos t))^2 + (2a \cos \frac{t}{2})^2 = 2a^2(1-\cos t + 2\cos^2 \frac{t}{2}) = 4a^2.$$

Demak,  $l = \int_0^{t_0} 2adt = 2at_0$ .

#### 10.4-misol. Ushbu

$$x = \int_1^t \frac{\sin \varphi}{\varphi} d\varphi; y = \int_1^t \frac{\cos \varphi}{\varphi} d\varphi, \quad 1 \leq t \leq t_0$$

tenglama bilan berilgan egri chiziqning uzunligini toping.

**Yechilishi.** Ravshanki,  $t=1$  bo‘lganda, egri chiziq koordinatalar boshidan o‘tadi.

$$\begin{aligned} x_t &= \left[ \int_1^t \frac{\sin \varphi}{\varphi} d\varphi \right]_t = \frac{\sin t}{t}, \quad y_t = \left[ \int_1^t \frac{\cos \varphi}{\varphi} d\varphi \right]_t = \frac{\cos t}{t}, \\ \sqrt{(x_t)^2 + (y_t)^2} &= \sqrt{\frac{\sin^2 t}{t^2} + \frac{\cos^2 t}{t^2}} = \frac{1}{t}. \end{aligned}$$

Shunday qilib, izlanayotgan chiziqning uzunligi, (10.2) formulaga asosan,

$$S = \int_1^{t_0} \sqrt{(x_t)^2 + (y_t)^2} dt = \int_1^{t_0} \frac{dt}{t} = \ln t_0.$$

**10.2. Qutb koordinatalar sistemasida berilgan chiziqning yoyi uzunligini hisoblash.** Agar  $\overset{\curvearrowleft}{AB}$  egri chiziq yoyi qutb koordinatalar sistemasida  $r = r(\varphi)$  ( $\varphi_1 \leq \varphi \leq \varphi_2$ ) tenglama bilan berilgan bo‘lib,  $r(\varphi)$  funksiya  $[\varphi_1, \varphi_2]$  da uzluksiz va uzluksiz hosilaga ega bo‘lsa, u holda, egri chiziqning *yoy uzunligi*,

$$l = AB = \int_{\varphi_1}^{\varphi_2} \sqrt{[r(\varphi)]^2 + [r'(\varphi)]^2} d\varphi \quad (10.4)$$

formula bo‘yicha hisoblanadi.

**10.5-misol.** Ushbu  $r = a(1-\sin \varphi)$ ,  $-\frac{\pi}{2} \leq \varphi \leq -\frac{\pi}{6}$  tenglama bilan berilgan chiziq yoyining uzunligini toping.

**Yechilishi.** Berilgan chiziqning,  $r = a(1-\sin \varphi)$  tenglamasidan,

$$\begin{aligned} r_\varphi &= -a \cos \varphi, \quad \sqrt{r^2 + (r_\varphi)^2} = \sqrt{a^2(1-\sin \varphi)^2 + a^2 \cos^2 \varphi} = \\ &= a \sqrt{1-2\sin \varphi + \sin^2 \varphi + \cos^2 \varphi} = a \sqrt{2-2\sin \varphi} \end{aligned}$$

ekanligini topamiz. Endi, izlanayotgan chiziq yoyining uzunligi, (10.4) formula yordamida topiladi:

$$l = \int_{-\frac{\pi}{2}}^{-\frac{\pi}{6}} a \sqrt{2-2\sin \varphi} d\varphi = a \sqrt{2} \cdot \int_{-\frac{\pi}{2}}^{-\frac{\pi}{6}} \sqrt{1-\sin \varphi} d\varphi = 2a.$$

### Mustaqil yechish uchun misollar

Quyidagi berilgan chiziqlarning ko'rsatilgan kesmalardagi yoy uzunliklarini toping:

**10.1.**  $y = \ln x, \frac{3}{4} \leq x \leq \frac{12}{5}$ .

**10.2.**  $y = 1 - \ln \cos x, 0 \leq x \leq \frac{\pi}{3}$ .

**10.3.**  $y = \sqrt{1-x^2} + \arcsin x, 0 \leq x \leq \frac{7}{9}$ .

**10.4.**  $y = e^x (0 \leq x \leq x_0)$ .

**10.5.**  $x = \frac{1}{4}y^2 - \frac{1}{2}\ln y (1 \leq y \leq e)$ .

**10.6.**  $y^2 = \frac{x^3}{2a-x} (0 \leq x \leq \frac{5}{3}a)$ .

**10.7.**  $y = \sqrt{\frac{x}{3}}(1-x), (0 \leq x_0 \leq x \leq 1)$ .

**10.8.**  $x = \frac{2}{3}\sqrt{(y-1)^3} (0 \leq x \leq 2\sqrt{3})$ .

**10.9.**  $y = \ln(x^2 - 1), 2 \leq x \leq 5$ .

**10.10.**  $y = a \operatorname{ch} \frac{x}{a}$  chiziqning,  $A(0; a)$  nuqtadan,  $B(b; h)$  nuqtagacha bo'lgan qismi.

**10.11.**  $y = \ln \sin x$  chiziqning, abssissalari,  $\frac{\pi}{2}$  va  $\frac{\pi}{3}$  bo'lgan nuqtalar orasidagi qismi.

**10.12.**  $y^2 = x^3$  chiziqning  $x = \frac{4}{3}$  to'g'ri chiziq bilan kesilgan qismi.

**10.13.**  $y = \frac{x^2}{2} - 1$  chiziqning  $Ox$  o'sq bilan kesilgan qismi.

**10.14.**  $y^2 = (x+1)^3$  chiziqning  $x=4$  to'g'ri chiziq bilan kesilgan qismi. **10.15.**  $y = \arcsine^{-x}$  chiziqning,  $x=0$  dan  $x=1$  gacha bo'lgan qismi.

Quyidagi berilgan chiziqlarning ko'rsatilgan kesmalardagi yoy uzunliklarini toping:

**10.16.**  $x = a(t - \sin t), y = a(1 - \cos t) (0 \leq t \leq 2\pi)$ .

**10.17.**  $x = a(\cos t + t \sin t), y = a(\sin t - t \cos t), (0 \leq t \leq 2\pi)$ .

**10.18.**  $x = a \cos^3 t, y = a \sin^3 t$ .

**10.19.**  $x = e^t (\cos t + \sin t), y = e^t (\cos t - \sin t), 0 \leq t \leq 1$ .

**10.20.**  $x = a \cos^5 t, y = a \sin^5 t (0 \leq t \leq 2\pi)$ .

**10.21.**  $x = a(\sin t - t), y = a(\operatorname{ch} t - 1) (0 \leq t \leq T)$ .

**10.22.**  $x = \sin^4 t, y = \cos^2 t, \left(0 \leq t \leq \frac{\pi}{2}\right)$ .

**10.23.**  $x = \int_1^t \frac{\sin \varphi}{\varphi} d\varphi, y = \int_1^t \frac{\cos \varphi}{\varphi} d\varphi, 1 \leq t \leq t_0$ .

**10.24.**  $x = 2a \cos t, y = 2a \sin t, z = at, (0 \leq t \leq 2\pi)$ .

**10.25.**  $x = \frac{2}{3}t^3 + \frac{1}{2}t^2, y = -\frac{4}{3}t^3 + \frac{1}{2}t^2, z = \frac{1}{3}t^3 + t^2, 0 \leq t \leq 1$ .

$$10.26. \quad x = e^t (\cos t + \sin t), \quad y = e^t (\cos t - \sin t), \quad z = ht, \quad 0 \leq t \leq 2\pi.$$

$$10.27. \quad x = a(\cos t + \ln t \frac{t}{2}), \quad y = a \sin t, \quad 0 < t_0 \leq t \leq \frac{\pi}{2}.$$

Quyida berilgan chiziqlarning ko'rsatilgan kesmalardagi yoy uzunliklarini toping:

$$10.28. \quad r = \cos^3 \frac{\varphi}{3}, \quad 0 \leq \varphi \leq \frac{\pi}{2}.$$

$$10.29. \quad r = \varphi^2, \quad 0 \leq \varphi \leq \pi.$$

10.30.  $r = a\varphi$  Arximed spiralining radiusi  $2a\pi$  bo'lган doiraning ichidagi qismi.

$$10.31. \quad r = ae^{m\varphi} \quad (m > 0, \quad 0 < r < a).$$

$$10.32. \quad r = \frac{p}{1 + \cos \varphi}, \quad |\varphi| \leq \frac{\pi}{2}.$$

$$10.33. \quad r = at \frac{\varphi}{2}, \quad 0 \leq \varphi \leq 2\pi.$$

$$10.34. \quad r = a(1 - \cos \varphi) \quad \text{kardioida.}$$

$$10.35. \quad r = a\varphi^3, \quad 0 \leq \varphi \leq 4.$$

$$10.36. \quad r = a\varphi^4, \quad 0 \leq \varphi \leq 3.$$

$$10.37. \quad r = a(1 - \sin \varphi), \quad -\frac{\pi}{2} \leq \varphi \leq -\frac{\pi}{6}.$$

$$10.38. \quad r = a(1 + \cos \varphi) \quad \text{kardoidaning uzunligi.}$$

$$10.39. \quad \varphi = \frac{1}{2} \left( r + \frac{1}{r} \right), \quad 1 \leq r \leq 3.$$

## 11-§. Aniq integral yordamida aylanma jismning hajmini hisoblash

**11.1. Dekart koordinatalar sistemasida berilgan aylanma jismning hajmini hisoblash.** Faraz qilaylik, bizga biror  $T$  jism berilgan bo‘lib, uning  $Oy$  o‘qqa parallel bo‘lgan kesimlarining yuzasi ma’lum bo‘lsin. Bu yuza,  $x$  o‘zgaruvchining funksiyasi bo‘ladi, uni  $S = S(x)$  orqali belgilaymiz (11.1-chizma).

Agar  $S = S(x)$  funksiya  $[a; b]$  kesmada uzlusiz bo‘lsa,  $T$  jismning  $V$  hajmi, ushbu

$$V = \int_a^b S(x)dx \quad (11.1)$$

formula bo‘yicha hisoblanadi.

11.1-chizma.

**11.1-misol.** Ushbu  $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$

ellipsoid sirt bilan chegaralangan jismning hajmini toping.

**Yechilishi.** Dastlab berilgan tenglama bo‘yicha ellipsoidni yasaymiz.

Ellipsoidni  $Oxz$  tekislikka parallel bo‘lgan,  $y \in [-b; b]$  kesmada o‘zgaruvchi,  $y = p$  tekisliklar bilan kesamiz. Kesimda ellips hosil bo‘ladi:

$$\frac{x^2}{a^2} + \frac{z^2}{c^2} = 1 - \frac{p^2}{b^2}, \quad 1 - \frac{p^2}{b^2} > 0, \quad \frac{x^2}{a^2} + \frac{z^2}{c^2} = 1.$$

Bunda ellipsning yarim o‘qlari,

$$a_1 = \frac{a}{b}\sqrt{b^2 - p^2}, \quad c_1 = \frac{c}{b}\sqrt{b^2 - p^2}. \quad \text{Bu kesimlarning yuzlari, } p \text{ ga bog‘liq}$$

bo‘lgan, ellips bilan chegaralangan yuzaga teng bo‘ladi:

$$S(p) = \pi a_1 b_1 = \frac{\pi ac}{b^2} (b^2 - p^2).$$

$s(p)$  kesimlarning yuzasini (11.1) formulaga keltirib quyib,  $\tau$  jismning hajmini topamiz:

$$V = \int_{-b}^b \frac{\pi ac}{b^2} (b^2 - p^2) dp = 2 \frac{\pi ac}{b^2} \int_0^b (b^2 - p^2) dp = 2 \frac{\pi ac}{b^2} \left( b^2 p - \frac{p^3}{3} \right) \Big|_0^b = \frac{4}{3} \pi abc.$$

Faraz qilaylik,  $y = f(x)$  funksiya  $[a, b]$  kesmada aniqlangan va uzlusiz bo'lib,  $\forall x \in [a, b]$  uchun  $f(x) \geq 0$  bo'lsin. Yuqoridan  $y = f(x)$  funksiya grafigi, yon tomonlardan  $x = a$ ,  $x = b$  vertikal to'g'ri chiziqlar, quyidan  $Ox$  o'qdagi  $[a, b]$  kesma bilan chegaralangan shaklni  $Ox$  o'q atrofida aylanishidan hosil bo'lgan aylanma  $\tau$  jismning hajmi (11.2-chizma),

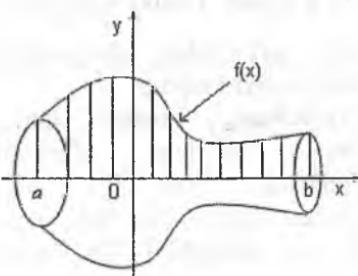

$$V_x = \pi \int_a^b f^2(x) dx \quad (11.2)$$

formula bo'yicha topiladi.

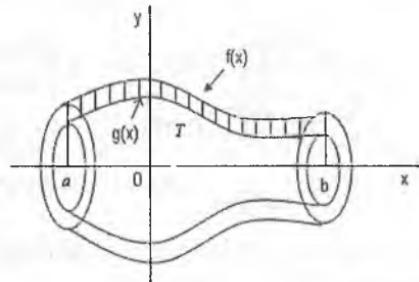

Agar  $D$  egri chiziqli trapesiya, yuqoridan  $f(x)$ , pastdan  $g(x)$  uzlusiz egri chiziqlar bilan, yon tomonlardan esa,  $x = a$  va  $x = b$  to'g'ri chiziqlar bilan chegaralangan bo'lsa, uning  $Ox$  o'q atrofida aylanishidan hosil bo'lgan aylanma  $\tau$  jismning hajmi (11.3-chizma),

$$V_x = \pi \int_a^b [f^2(x) - g^2(x)] dx \quad (11.3)$$

formula bo'yicha topiladi.

11.2- chizma.

11.3- chizma.

$y = y(x)$  funksiya,  $[\alpha, \beta]$  kesmada  $x = x(t)$ ,  $y = y(t)$  parametrik tenglamalari bilan berilgan bo'lsin. Bu funksiyalar  $[\alpha, \beta]$  da uzlusiz,  $\forall t \in [\alpha, \beta]$  kesmada  $y(t) \geq 0$  va  $x(t)$  funksiya, uzlusiz, manfiy bo'lmasigan  $x'(t)$  hosilaga ega, hamda  $a = x(\alpha)$ ,  $b = x(\beta)$  bo'lsa, u holda,  $\tau$  aylanma jismning hajmi,

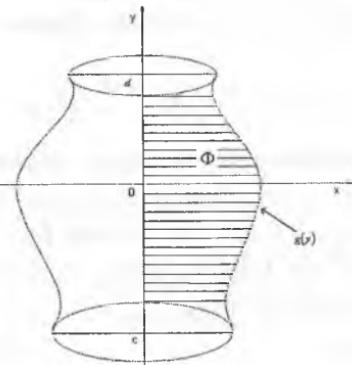

$$V = \pi \int_a^{\beta} y^2(t) x'(t) dt \quad (11.4)$$

formula bo'yicha topiladi.

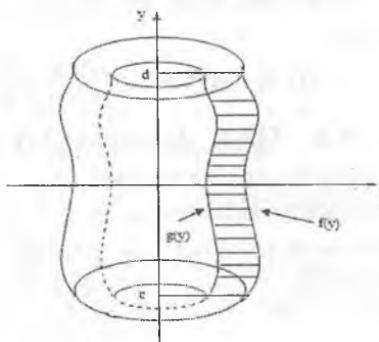

Agar  $x(t)$  funksiya  $[\alpha, \beta]$  kesmada kamayuvchi va  $a = x(\alpha)$ ,  $b = x(\beta)$  bo'lsa, u holda, yuqoridagi shartlar bajarilganda,  $T$  aylanma jismning hajmi,

$$V = -\pi \int_{\alpha}^{\beta} y^2(t) x'(t) dt$$

formula bo'yicha topiladi.

11.4- chizma.

11.5- chizma.

$Oy$  ( $x=0$ ) o'q atrofida aylantirishdan hosil bo'lgan  $\phi$  aylanma jismning hajmi (11.4-, 11.5- chizma), yuqoridagi (11.2), (11.3), (11.4) formulalarga o'xshash quyidagi

$$V_y = \pi \int_c^d g^2(y) dy,$$

$$V_y = \pi \int_c^d [f^2(y) - g^2(y)] dy,$$

$$V = \pi \int_a^b x^2(t) y'(t) dt$$

formulalar bo'yicha topiladi.

**11.2-misol.** Quyidagi,  $y^2 = 2px$ ,  $y=0$ ,  $x=a$  chiziqlar bilan chegaralangan shaklni,  $Ox$  ( $y=0$ ) o'q atrofida aylantirishdan hosil bo'lgan aylanma jismning hajmini toping.

**Yechilishi.** D soha, yuqoridan  $y^2 = 2px$  uzluksiz funksiya bilan, yon tomonlardan,  $x=a$  va  $x=0$  to'g'ri chiziqlar, pastdan esa,  $Ox$  ( $y=0$ ) o'q

bilan chegaralangan. Endi,  $D$  egri chiziqli sohani  $Ox$  ( $y=0$ ) o'q atrofida aylantirishdan hosil bo'lgan aylanma jismning hajmini, (11.2) formula bo'yicha hisoblaymiz:

$$V_x = \pi \int_0^a y^2 dx = \pi \int_0^a 2px dx = 2p\pi \left. \frac{x^2}{2} \right|_0^a = \pi pa^3.$$

**11.3-misol.** Quyidagi,  $x = a(t - \sin t)$ ,  $y = a(1 - \cos t)$ ,  $(1 \leq t \leq 2\pi)$ ,  $y=0$  chiziqlar bilan chegaralangan shaklni  $Ox$  ( $y=0$ ) o'q atrofida aylantirishdan hosil bo'lgan aylanma jismning hajmini toping.

**Yechilishi.** Aylanma jismning hajmini (11.4) formula bo'yicha topamiz:

$$V_x = \pi \int_0^{2\pi} a^2 (1 - \cos t)^2 a(1 - \cos t) dt = \pi a^3 \int_0^{2\pi} (1 - \cos t)^3 dt = 8\pi a^3 \int_0^{2\pi} \left( \sin^2 \frac{t}{2} \right)^3 dt = 5\pi a^3.$$

**11.2. Qutb koordinatalar sistemasida berilgan aylanma jismning hajmini hisoblash.** Agar  $\hat{AB}$  egri chiziqning tenglamasi qutb koordinatalar sistemasida  $r = r(\varphi)$ ,  $0 \leq \alpha \leq \varphi \leq \beta \leq 2\pi$ , ko'rinishda berilgan bo'lib,  $[\alpha, \beta]$  kesmada  $r(\varphi)$  - uzlusiz bo'lsa, u holda, qutb nuri atrofida  $T = \{(r, \varphi) : \alpha \leq \varphi \leq \beta, 0 \leq r \leq r(\varphi)\}$  aylanma sektorning hajmi,

$$V = \frac{2\pi}{3} \int_{\alpha}^{\beta} r^3(\varphi) \sin \varphi d\varphi \quad (11.5)$$

formula bo'yicha topiladi.

Agar  $\hat{AB}$  egri chiziq tenglamasi qutb koordinatalar sistemasida  $r = r(\varphi)$ ,  $-\frac{\pi}{2} \leq \alpha \leq \varphi \leq \beta \leq \frac{\pi}{2}$ , ko'rinishda berilgan bo'lib,  $[\alpha, \beta]$  kesmada  $r(\varphi)$  uzlusiz bo'lsa, u holda,  $\varphi = \frac{\pi}{2}$  qutb nuri atrofida  $T = \{(r, \varphi) : \alpha \leq \varphi \leq \beta, 0 \leq r \leq r(\varphi)\}$  aylanma sektorning hajmi,

$$V = \frac{2\pi}{3} \int_{\alpha}^{\beta} r^3(\varphi) \cos \varphi d\varphi$$

formula bo'yicha topiladi.

**11.4-misol.** Ushbu  $r = a(1 + \cos \varphi)$  kardiodaning qutb o'qi atrofida aylantirishdan hosil bo'lgan aylanma jismning hajmini toping.

**Yechilishi.**  $r = a(1 + \cos \varphi)$  kardiodaning qutb o'qi atrofida aylantirishdan hosil bo'lgan aylanma jismning hajmini, (11.5) formulaga ko'ra, topamiz:

$$\begin{aligned} V &= \frac{2\pi}{3} \int_{\alpha}^{\beta} r^3(\varphi) \sin \varphi d\varphi = \frac{2\pi}{3} \int_0^{\pi} a^3 (1 - \cos \varphi)^3 \sin \varphi d\varphi = \\ &= \frac{\pi}{6} a^3 (1 - \cos \varphi)^4 = \frac{8\pi}{3} a^3. \end{aligned}$$

## Mustaqil yechish uchun misollar

Quyidagi chiziqlar bilan chegaralangan figuralarni ko'rsatilgan o'q atrofida aylantirishdan hosil bo'lган aylanma jismlarning hajmlarini toping:

11.1.  $y = \sin x$ ,  $0 \leq x \leq \pi$ : a)  $Ox$  o'q atrofida. b)  $Oy$  o'q atrofida.

11.2.  $y = 2x - x^2$ ,  $y = 0$ : a)  $Ox$  o'q atrofida. b)  $Oy$  o'q atrofida.

11.3.  $y = \sin 2x$ ,  $0 \leq x \leq \frac{\pi}{2}$ ,  $y = 0$ :  $Ox$  o'q atrofida.

11.4.  $y = b \sqrt{\left(\frac{x}{a}\right)^2}$ ,  $0 \leq x \leq a$   $Ox$  o'q atrofida.

11.5.  $xy = 4$ ,  $x = 1$ ,  $x = 4$ ,  $y = 0$   $Ox$  o'q atrofida.

### 12-§. Aniq integral yordamida aylanma jism sirtining yuzini hisoblash

**12.1. Dekart koordinatalar sistemasida berilgan aylanma sirt yuzini hisoblash.**  $y=f(x)$  funksiya  $[a; b]$  kesmada aniqlangan uzlucksiz va uzlucksiz  $f'(x)$  hosilaga ega bo‘lib,  $\forall x \in [a; b]$  uchun,  $f'(x) \geq 0$  bo‘lsin. Bu

funksiya grafigining  $A(a; f(a))$  va  $B(b; f(b))$  nuqtalar orasidagi  $\hat{AB}$  yoyini  $Ox$  o‘q atrofida aylantirish natijasida hosil bo‘lgan sirtning yuzi,

$$Q_x = 2\pi \int_a^b f(x) \sqrt{1+(f'(x))^2} dx \quad (12.1)$$

formula orqali hisoblanadi.

Agar  $\hat{AB}$  egri chiziq,  $x = \phi(t)$ ,  $y = \psi(t)$ ,  $\alpha \leq t \leq \beta$ , tenglama bilan berilgan bo‘lib,  $\psi(t) \geq 0$ ,  $\phi(t)$  funksiya,  $t \in \alpha$  dan  $\beta$  gacha o‘zgarganda,  $a$  dan  $b$  gacha o‘zga-rib,  $\phi(\alpha) = a$ ,  $\phi(\beta) = b$  bo‘lsa, u holda, (12.1) formulada,  $x = \phi(t)$  almashtirish natijasida,

$$Q_x = 2\pi \int_a^\beta \psi(t) \sqrt{(\phi'(t))^2 + (\psi'(t))^2} dt \quad (12.2)$$

formulani hosil qilamiz, ya’ni  $\hat{AB}$  egri chiziqning tenglamasi parametrik shaklda berilganda, uning  $Ox$  o‘q atrofida aylanishi natijasida hosil bo‘lgan sirtning yuzini topish formulasini hosil qilamiz.

**12.1-misol.** Ushbu  $y^2 = 2px$  ( $0 \leq x \leq x_0$ ) chiziqning: a)  $Ox$  o‘q ; b)  $Oy$  o‘q atrofida aylanishi natijasida hosil bo‘lgan sirtning yuzini toping.

**Yechilishi.** a) Berilgan chiziqning  $Ox$  o‘q atrofida aylanishi natijasida hosil bo‘lgan sirtning yuzi, (12.1) formulaga asosan topiladi, bunda,  $f(x) = \sqrt{2px}$ ,  $f'(x) = \frac{p}{\sqrt{2px}}$ ,  $\sqrt{1+(f'(x))^2} = \sqrt{1+\frac{p}{2x}}$ .

Shunday qilib, berilgan chiziqning  $Ox$  o‘q atrofida aylanishi natijasida hosil bo‘lgan sirtning yuzi:

$$\begin{aligned} Q_x &= 2\pi \int_0^{x_0} f(x) \sqrt{1+(f'(x))^2} dx = 2\pi \sqrt{p} \int_0^{x_0} \sqrt{p+2x} dx = \\ &= \frac{2\pi\sqrt{p}}{3} [\sqrt{(p+2x_0)^3} - \sqrt{p^3}] = \frac{2\pi}{3} [(p+2x_0)\sqrt{p^2+2px_0} - p^2]. \end{aligned}$$

b) Berilgan chiziqning  $Ox$  o‘qqa nisbatan simmetrikligini e’tiborga olib, izlanayotgan sirtning yuzini,

$$Q_y = 4\pi \int_0^{\sqrt{2px_0}} x(y) \sqrt{1+[x'(y)]^2} dy$$

formula orqali topamiz:

$$\begin{aligned}
Q_y &= \frac{2\pi}{p} \int_0^{\sqrt{2px_0}} y^2 \sqrt{1 + \frac{y^2}{p^2}} dy = \frac{2\pi}{p^3} \int_0^{\sqrt{2px_0}} y^2 \sqrt{p^2 + y^2} dy = \\
&= [u = y, dv = y\sqrt{p^2 + y^2} dy, du = dy, v = \frac{1}{3}(p^2 + y^2)^{\frac{3}{2}}] = \\
&= \frac{2\pi}{p^3} \left[ \frac{y(p^2 + y^2)^{3/2}}{4} - \frac{p^2}{8} [y\sqrt{p^2 + y^2} + p^2 \ln(y + \sqrt{p^2 + y^2})] \right] \Big|_0^{\sqrt{2px_0}} = \\
&= \frac{\pi}{4} [(p + 4x_0)\sqrt{2x_0(p + 2x_0)} - p^2 \ln \frac{\sqrt{2x_0} + \sqrt{p + 2x_0}}{\sqrt{p}}]
\end{aligned}$$

**12.2-misol.** Ushbu  $x = a(t - \sin t)$ ,  $y = a(1 - \cos t)$  ( $0 \leq t \leq 2\pi$ ), chiziqning  $Ox$  o‘q atrofida aylanishi natijasida hosil bo‘lgan sirtning yuzini toping.

**Yechilishi.** Izlanayotgan sirtning yuzi, (12.2) formula orqali hisoblanadi:

$$\begin{aligned}
x'_t &= a(1 - \cos t), y'_t = a \sin t, ds = \sqrt{(x'_t)^2 + (y'_t)^2} dt = \\
&= \sqrt{a^2(1 - \cos t)^2 + a^2 \sin^2 t} dt = a\sqrt{2}\sqrt{1 - \cos t} \cdot dt = 2a \sin \frac{t}{2} dt, \\
Q &= 2\pi \int_0^{2\pi} a(1 - \cos t) \cdot 2a \cdot \sin \frac{t}{2} dt = 2\pi \int_0^{2\pi} 4a^2 \sin^3 \frac{t}{2} dt = \\
&= 16\pi a^2 \int_0^{\pi} \sin^3 v dv = \frac{64}{3}\pi a^2
\end{aligned}$$

**12.2. Qutb koordinatalar sistemasida berilgan aylanma sirtning yuzini hisoblash.** Agar  $\overset{\circ}{AB}$  egri chiziqning tenglamasi, qutb koordinatalar sistemasida,  $r = r(\phi)$ ,  $\alpha \leq \phi \leq \beta$ , ko‘rinishda berilgan bo‘lib,  $r(\phi)$  -  $[\alpha, \beta]$  kesmada uzlusiz, uzlusiz hosilaga ega bo‘lsa, u holda, (12.2) formula,

$$Q = 2\pi \int_a^\beta r(\phi) \sin \phi \sqrt{(r(\phi))^2 + (r'(\phi))^2} d\phi \quad (12.3)$$

ko‘rinishda bo‘ladi.

**12.3 -misol.** Ushbu  $r^2 = a^2 \cos 2\phi$  chiziqning: a) qutb o‘qi; b)  $\phi = \frac{\pi}{2}$  o‘q atrofida aylanishi natijasida hosil bo‘lgan sirtlarning yuzlarini toping.

**Yechilishi.** a) Ma’lumki,  $r = a\sqrt{\cos 2\phi}$  - Bernulli lemniskatasi bo‘lib, koordinatalar o‘qlariga nisbatan simmetrik joylashgan, koordinatalar boshi - qutb bilan, musbat yarim o‘q - qutb o‘qi bilan mos tushadi. Shuning uchun, izlanayotgan sirtning yuzi, (12.3) formulaga asosan topiladi:

$$Q = 4\pi \int_0^{\frac{\pi}{4}} r(\varphi) \sin \varphi \sqrt{r^2(\varphi) + (r'(\varphi))^2} d\varphi, \quad r \sin \varphi = a \sqrt{\cos 2\varphi} \cdot \sin \varphi,$$

$$r_{\varphi} = -\frac{a \sin 2\varphi}{\sqrt{\cos 2\varphi}}, \quad \sqrt{r^2 + (r_{\varphi})^2} = \frac{a}{\sqrt{\cos 2\varphi}}, \quad Q_r = 4\pi^2 \int_0^{\frac{\pi}{4}} \sin \varphi d\varphi = 2\pi a^2 (2 - \sqrt{2})$$

b) Xuddi yuqoridagi a) banddagidek,

$$Q_{\text{sum}} = 4\pi a^2 \int_0^{\frac{\pi}{4}} \cos \varphi d\varphi = 2\sqrt{2}\pi a^2.$$

Bu holda,  $\varphi = \frac{\pi}{4}$  nurni,  $r_i, \theta$  sistemadagi qutb o‘qi, deb qabul qilamiz, u holda,  $r_i(\theta) = r(\varphi)$ ,  $\theta = \varphi - \frac{\pi}{4}$ . Shunday qilib, izlanayotgan sirtning yuzi:  $Q = Q_1 + Q_2$  bo‘lib,  $Q_1$  va  $Q_2$  ,mos ravishda,

$$\begin{aligned} Q_1 &= 4\pi \int_{\theta=-\frac{\pi}{2}}^{\frac{\pi}{4}} r_i(\theta) |\sin \theta| \cdot \sqrt{r_i^2(\theta) + (r'_i(\theta))^2} d\theta, \\ Q_2 &= 4\pi \int_{\theta=\frac{\pi}{4}}^{\frac{\pi}{2}} r_i(\theta) |\sin \theta| \cdot \sqrt{r_i^2(\theta) + (r'_i(\theta))^2} d\theta \end{aligned} \quad (*)$$

formulalar orqali topiladi( $r_i, \theta$  sistemasida,  $\theta$  ,  $-\frac{\pi}{2}$  dan 0 gacha o‘zgarganda,  $\sin \theta$  funksiya manfiy qiymatlar qabul qiladi). (\*) formulalarda  $r_i, \theta$  dan,  $r$  va  $\varphi$  larga o‘tsak, u holda,

$$\begin{aligned} Q_1 &= 4\pi a^2 \int_{-\frac{\pi}{4}}^0 \sqrt{\cos 2\varphi} \left| \sin \left( \varphi - \frac{\pi}{4} \right) \right| \frac{d\varphi}{\sqrt{\cos 2\varphi}} = 4\pi a^2 \int_{-\frac{\pi}{4}}^0 \left| \sin \left( \varphi - \frac{\pi}{4} \right) \right| d\varphi = \\ &= 4\pi a^2 \int_0^{\frac{\pi}{4}} \sin \left( \varphi - \frac{\pi}{4} \right) d\varphi = -4\pi a^2 \cos \left( \varphi - \frac{\pi}{4} \right) \Big|_0^{\frac{\pi}{4}} = 2\pi a^2 \sqrt{2}, \\ Q_2 &= 4\pi a^2 \int_0^{\frac{\pi}{4}} \left| \sin \left( \varphi - \frac{\pi}{4} \right) \right| d\varphi = -4\pi a^2 \int_0^{\frac{\pi}{4}} \sin \left( \varphi - \frac{\pi}{4} \right) d\varphi = \\ &= 4\pi a^2 \cos \left( \varphi - \frac{\pi}{4} \right) \Big|_0^{\frac{\pi}{4}} = 2\pi a^2 (2 - \sqrt{2}). \end{aligned}$$

### Mustaqil yechish uchun misollar

Quyidagi chiziqlarni ko‘rsatilgan o‘q atrofida aylantirishda hosil bo‘lgan aylanma sirtlarining yuzlarini hisoblang:

**12.1.**  $y = \frac{x^2}{2}$  parabolaning  $y=1,5$  to‘g‘ri chiziq bilan kesilgan qismini,  $x=2$  o‘q atrofida.

**12.2.**  $y^2 = 4 + x$  parabolaning  $x=2$  to‘g‘ri chiziq bilan kesilgan qismini  $Ox$  o‘q atrofida.

**12.3.**  $y = \cos \frac{\pi x}{2a}$  chiziqning,  $x_1 = -a$  dan  $x_2 = a$  gacha bo‘lgan qismining  $Ox$  o‘q atrofida.

### 13-§. Aniq integralning mexanika masalalariga tadbig'i

**13.1 Silliq egri chiziqning statik momenti va og'irlik markazi.**  
 Biror  $m$ -massaga ega bo'lgan moddiy nuqtaning biror  $p$  o'qqa nisbatan statik momenti deb, uning  $m$  massasi bilan undan  $p$  o'qqacha bo'lgan  $d$

masofaning ko‘paytmasiga, ya’ni  $M_p = md$  songa aytildi. Tekislikda yotgan massalari mos ravishda,  $m_1, m_2, \dots, m_n$ ,  $p$  o‘qga nisbatan masofalari  $d_1, d_2, \dots, d_n$  bo‘lgan  $n$  ta moddiy nuqtalar sistemasining statik momenti,

$$M_p = \sum_{i=1}^n m_i d_i$$

bo‘ladi, bunda o‘qning bir tomonida yotgan nuqtalarning masofalari musbat ishora bilan, ikkinchi tomonida yotganlarining masofalari esa, manfiy ishora bilan olinadi.

Agar massa, ayrim olingan nuqtalarda tarqalmasdan, biror silliq chiziq yoki tekis figura bo‘ylab tekis tarqalgan bo‘lsa, u holda, statik momentdagi yig‘indi o‘rniga integral olinadi.

Faraz qilaylik,  $xOy$  tekislikda  $m$  massali biror  $(AB)$  silliq egri chiziq berilgan bo‘lib, uning uzunligi  $l$  bo‘lsin.

$(AB)$  silliq egri chiziqning har bir nuqtasidagi chiziqli zichlik  $\rho = \rho(s) - s$  o‘zgaruvchining uzliksiz funksiyasi bo‘lsin (13.1- chizma). U holda,  $(AB)$  silliq egri chiziqning massasi quyidagi formula bo‘yicha topiladi:

$$m = \int_0^l \rho(s) ds,$$

bunda,  $ds = \sqrt{(dx)^2 + (dy)^2}$  - yoy differensiali,  $l$  esa, berilgan chiziqning uzunligi.

**Eslatma.** Agar  $(AB)$  silliq egri chiziqni *birjinsli* deb faraz qilsak, u holda, uning  $\rho$  chiziqli zichligi (bir birlik uzunlikdagi massa, uning uzunligi bilan o‘lchanadi), o‘zgarmas, deb qaraymiz. Soddalik uchun,  $\rho = 1$  deb olamiz.

$(AB)$  chiziqning elementar  $ds$  bo‘lagini ajratamiz. Yuqoridagi farazimiz bo‘yicha,  $ds$  elementar bo‘lakdagi massa,  $m$  son orqali ifodalanadi. Chiziqning elementar  $ds$  yoyini, taqrifiy moddiy nuqta, deb qabul qilsak, u holda, uning  $Ox$  o‘qqa nisbatan elementar statik momenti,

$$dM_x = y ds$$

bo‘ladi. Erkli o‘zgaruvchi sifatida,  $A$  nuqtadan boshlab hisoblanadigan,  $ds$  yoyni olib, elementar statik momentlarni yig‘sak, natijada

$$M_x = \int_0^l y(s) \rho(s) ds$$

bo‘ladi. Xuddi shunday,  $Oy$  o‘qqa nisbatan statik moment,

$$M_y = \int_0^l x(s)\rho(s)ds$$

bo‘ladi.

$m$  massali, chiziqli zichligi  $\rho = \rho(s)$  bo‘lgan ( $AB$ ) egri chiziqning  $M(x_M; y_M)$  og‘irlilik markazi koordinatalari esa, ushbu

$$x_M = \frac{M_v}{m} = \frac{\int_0^l x(s)\rho(s)ds}{\int_0^l \rho(s)ds}, \quad y_M = \frac{M_x}{m} = \frac{\int_0^l y(s)\rho(s)ds}{\int_0^l \rho(s)ds}$$

formulalar yordamida xisoblanadi.

$m$  massali, chiziqli zichligi  $\rho = \rho(s)$  bo‘lgan ( $AB$ ) egri chiziqning  $Ox$  va  $Oy$  o‘qlarga nisbatan inersiya momentlari,

$$I_x = \int_0^l y^2(s)\rho(s)ds, \quad I_v = \int_0^l x^2(s)\rho(s)ds$$

formulalar yordamida hisoblanadi.

Xususiy holda, birjinsli ( $\rho(s)=1$ ) bo‘lgan ( $AB$ ) egri chiziqning  $m$  massasi,  $Ox$  va  $Oy$  o‘qlarga nisbatan,  $M_x, M_y$  statik va  $I_x, I_v$  inersiya momentlari, hamda  $M(x_M; y_M)$  og‘irlilik markazining koordinatalari, mos ravishda,

$$\begin{aligned} m &= \int_0^l ds = l, \quad M_x = \int_0^l y(s)ds, \quad M_y = \int_0^l x(s)ds \\ I_x &= \int_0^l y^2(s)ds, \quad I_v = \int_0^l x^2(s)ds \end{aligned} \tag{13.1}$$

$$x_M = \frac{M_v}{l}, \quad y_M = \frac{M_x}{l} \quad \text{formulalar yordamida hisoblanadi.}$$

**Teorema (Guldinning bиринчи теоремаси).** ( $AB$ ) egri chiziqni, uni kesib o‘tmaydigan, o‘q atrofida aylantirish natijasida hosil bo‘lgan aylanish sirtining yuzi, uning og‘irlilik markazi chizgan aylana uzunligining shu egri chiziqning  $l$  yoy uzunligiga ko‘paytmasiga teng:

$$2\pi y_M l = 2\pi \int_0^l y dl \quad . \tag{13.2}$$

**13.1-misol.** Ushbu  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$  ellips yuqori qismining  $Ox$  o‘qqa nisbatan statik momentini toping.

**Yechilishi.** Ellips yuqori qismining  $Ox$  o‘qqa nisbatan statik momenti

$$M_x = \int_a^b ydl$$

formula bo'yicha topiladi, bunda  $dl$  - elementar yoy uzunligi. Shartga ko'ra,  $y \geq 0$ , u holda,

$$ydl = y\sqrt{1+y'^2}dx = \sqrt{y^2 + (yy')^2}dx, \quad y^2 = b^2 - \frac{b^2}{a^2}x^2, \quad yy' = -\frac{b^2}{a^2}x,$$

$$ydl = \sqrt{b^2 - \frac{b^2}{a^2}x^2 + \frac{b^4}{a^4}x^2}dx = \frac{b}{a}\sqrt{a^2 - \varepsilon^2x^2}dx, \quad \varepsilon^2 = \frac{a^2 - b^2}{a^2},$$

$\varepsilon$  - ellipsning ekszentriteti.

: Shunday qilib,

$$M_x = \int_a^b \sqrt{a^2 - \varepsilon^2x^2}dx = b\left(b - \frac{a}{\varepsilon} \operatorname{arc sin} \varepsilon\right).$$

**13.2-misol.** Ushbu  $x = a(t - \sin t)$ ,  $y = a(1 - \cos t)$  ( $0 \leq t \leq 2\pi$ ), egri chiziqning og'irlik markazini toping.

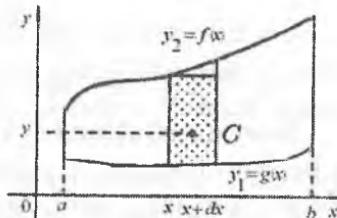

**Yechilishi.** Berilgan birjinsli egri chiziq,  $x = \pi a$  to'g'ri chiziqqa nisbatan simmetrik bo'lgani uchun, uning og'irlik markazi shu to'g'ri chiziqda yotadi, ya'ni  $x_M = \pi a$ . 10.2 - va 12.2 - misollarni e'tiborga olgan holda, Guldinning birinchi teoremasiga asosan, ya'ni (13.2) formuladan,

$$2\pi y_M \cdot 8a = \frac{64}{3} \cdot \pi a^2, \quad \eta = \frac{4}{3}a$$

ekanligini olamiz. Demak, sikloidaning og'irlik markazi,  $M\left(\pi a; \frac{4}{3}a\right)$ .

### 13.2. Tekis figuraning statik momentlari va og'irlik markazi.

Tekis figura, yuqorida  $y_2 = f(x)$ , quyidan  $y_1 = g(x)$  funksiyalar, yon tomonlaridan esa,  $x=a$  va  $x=b$  vertikal chiziqlar bilan chegaralangan bo'lsin.  $m$  massali tekis figuraning har bir nuqtasida chiziqli zinchligi  $\rho = \rho(x)$  x o'zgaruvchining uzlusiz funksiyasi bo'lsin (13.2-chizma).

#### 13.2-chizma.

Tekis figuraning  $m$  massasi,  $Ox$  va  $Oy$  o'qlarga nisbatan,  $M_x, M_y$ , statik va  $I_x, I_y$  inersiya momentlari, hamda  $M(x_M; y_M)$  og'irlik markazining koordinatalari, mos ravishda, quyidagi,

$$m = \int_a^b (f(x) - g(x))\rho(x)dx,$$

$$M_x = \frac{1}{2} \int_a^b (f^2(x) - g^2(x)) \rho(x) dx, \quad M_y = \int_a^b x[f(x) - g(x)] \rho(x) dx, \quad (13.3)$$

$$I_x = \frac{1}{3} \int_0^l [f^3(x) - g^3(x)] \rho(x) dx, \quad I_y = \int_a^b x^2[f(x) - g(x)] \rho(x) dx,$$

$$x_M = \frac{M_y}{m}, \quad y_M = \frac{M_x}{m}$$

formulalar yordamida hisoblanadi.

**13.1-eslatma.** Tekis figura bo'ylab massa tekis tarqalgan, ya'ni uning sirt zinchligi  $\rho$  o'zgarmas bo'lzin. Umumiylikni buzmasdan,  $\rho=1$  deb olamiz. U holda, tekis figuraning  $m$  massasi,  $Ox$  va  $Oy$  o'qlarga nisbatan  $M_x, M_y$  statik va  $I_x, I_y$  inersiya momentlari, hamda  $M(x_M; y_M)$  og'irlik markazining koordinatalari, mos ravishda,

$$m = \int_a^b (f(x) - g(x)) dx = S,$$

$$M_x = \frac{1}{2} \int_a^b (f^2(x) - g^2(x)) dx, \quad M_y = \int_a^b x[f(x) - g(x)] dx,$$

$$I_x = \frac{1}{3} \int_0^l [f^3(x) - g^3(x)] dx, \quad I_y = \int_a^b x^2[f(x) - g(x)] dx,$$

$$x_M = \frac{M_y}{S}, \quad y_M = \frac{M_x}{S}$$

formulalar yordamida hisoblanadi, bu yerda,  $S = \int_a^b y(x) dx$  – tekis figuraning yuzi.

Og'irlik markazining ordinatasi formulasidan,  $2\pi y_M \cdot S = \pi \int_a^b y^2 dx$  munosabatni hosil qilamiz. Bu formulaning o'ng tomoni,  $ABCD$  figurani  $Ox$  o'q atrofida aylantirish natijasida hosil bo'lgan jismning hajmini ifodalaydi, chap tomoni esa, og'irlik markazi va u chizgan aylana uzunligini, figuraning yuziga ko'paytmasiga teng bo'lar ekan. Shunday qilib, quyidagi Guldinining ikkinchi teoremasiga kelamiz.

**Teorema (Guldinining ikkinchi teoremasi).** Tekis figurani, uni kesmaydigan o'q atrofida aylantirish natijasida hosil bo'lgan jismning hajmi, uning og'irlik markazi chizgan aylana uzunligini tekis figuraning yuziga ko'paytmasiga teng, ya'ni  $V = 2\pi \eta \cdot S$ .

Qutb koordinatalar sistemasida sektor,  $0 \leq r \leq r(\phi)$ ,  $\alpha \leq \phi \leq \beta$ , tengsizliklar orqali berilgan bo'lzin, bunda  $0 < \beta - \alpha \leq 2\pi$ ,  $r(\phi)$  funksiya  $[\alpha, \beta]$  kesmada uzlusiz. Massa sektorda tekis tarqalgan bo'lzin, ya'ni uning  $\rho$  zinchligi o'zgarmas bo'lzin. Bu erda ham, umumiylikni

buzmaslik uchun,  $\rho = 1$  deb olamiz. U holda,  $Ox$  va  $Oy$  o'qlarga nisbatan statik momentlar va og'irlik markazining koordinatalari, quyidagi

$$M_x = \frac{1}{3} \int_{\alpha}^{\beta} r^3(\varphi) \sin \varphi d\varphi, \quad M_y = \frac{1}{3} \int_{\alpha}^{\beta} r^3(\varphi) \cos \varphi d\varphi,$$

$$x_M = \frac{M_y}{S}, \quad y_M = \frac{M_x}{S},$$

formulalar orqali topiladi, bunda  $S$  - sektorning yuzi, ya'ni

$$S = \frac{1}{2} \int_{\alpha}^{\beta} r^2(\varphi) d\varphi.$$

**13.3 - misol.** Ushbu  $\frac{x}{a} + \frac{y}{b} = 1$ ,  $x = 0$ ,  $y = 0$ ,  $a > 0, b > 0$  chiziqlar bilan chegaralangan tekis figuraning  $Ox$  va  $Oy$  o'qlarga nisbatan statik momentlari va og'irlik markazining koordinatalarini toping.

**Yechilishi.** (13.3) formulalarga asosan,

$$M_x = \frac{1}{2} \int_b^a \frac{b^2}{a^2} (a-x)^2 dx = -\frac{b^2}{2a^2} \frac{(a-x)^3}{3} \Big|_b^a = \frac{ab^2}{6},$$

$$M_y = \int_0^a x \cdot \frac{b}{a} (a-x) dx = \frac{b}{a} \int_0^a (ax - x^2) dx = \frac{b}{a} \left( ax \frac{x^2}{2} - \frac{x^3}{3} \right) \Big|_0^a = \frac{a^2 b}{6},$$

$$S = \int_0^a \frac{b}{a} (a-x) dx = \frac{b}{a} \int_0^a (a-x) dx = \frac{b}{a} \left( ax - \frac{x^2}{2} \right) \Big|_0^a = \frac{b}{a} \cdot a^2 \left( 1 - \frac{1}{2} \right) = \frac{ab}{2},$$

$$x_M = \frac{M_y}{S} = \frac{\frac{a^2 b}{6}}{\frac{ab}{2}} = \frac{a}{3}; \quad y_M = \frac{M_x}{S} = \frac{\frac{ab^2}{6}}{\frac{ab}{2}} = \frac{b}{3}.$$

Demak,  $M(x_M; y_M) = M\left(\frac{a}{3}; \frac{b}{3}\right)$ .

**13.4-misol.** Ushbu  $x = a \sin t$ ,  $y = b \cos t$ ,  $|t| \leq \frac{\pi}{2}$ ,  $y = 0$  chiziqlar bilan chegaralangan sohaning  $Ox$  va  $Oy$  o'qlarga nisbatan statik momentlari va og'irlik markazining koordinatalarini toping.

**Yechilishi.** (13.3) formulalarga asosan,

$$M_x = \frac{1}{2} \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} b^2 \cos^2 t \cdot a \cos t dt = \frac{ab^2}{2} \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} (1 - \sin^2 t) d(\sin t) = \frac{ab^2}{2} \left( \sin t - \frac{\sin^3 t}{3} \right) \Big|_{-\frac{\pi}{2}}^{\frac{\pi}{2}} = \frac{2ab^2}{3},$$

$$M_y = \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} a \sin t \cdot b \cos t \cdot a \cos t dt = -a^2 b \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \cos^2 t d \cos t = -\frac{a^2 b}{3} \cos^3 t \Big|_{-\frac{\pi}{2}}^{\frac{\pi}{2}} = 0$$

$$S = \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} b \cos t \cdot a \cos t dt = ab \int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \cos^2 t dt = ab \left( \frac{1}{2}t + \frac{\sin 2t}{4} \right) \Big|_{-\frac{\pi}{2}}^{\frac{\pi}{2}} = ab \cdot \left( \frac{2 \cdot \pi}{4} \right) = \frac{ab\pi}{2}.$$

$$x_M = \frac{M_y}{S} = \frac{0}{S} = 0; \quad y_M = \frac{M_x}{S} = \frac{\frac{3}{2}ab^2}{\frac{ab\pi}{2}} = \frac{4b}{3\pi}.$$

**13.5-misol.** Guldinning ikkinchi teoremasidan foydalanib,  $x^2 + (y - b)^2 = a^2$ ,  $a < b$ , doiraning  $Ox$  o'q atrofida aylanishi natijasida hosil bo'lgan torning hajmini toping.

**Yechilishi.** Ma'lumki, berilgan doiraning yuzi  $S = \pi a^2$ , doiraning og'irlik markazi, uning markazida bo'ladi. Demak, doiraning  $Ox$  o'q atrofida aylanishi natijasida, uning og'irlik markazi chizgan aylananing uzunligi,  $2\pi b$  ga teng. U holda, Guldinning ikkinchi teoremasiga asosan, izlanayotgan hajm,

$$V = \pi a^2 \cdot 2\pi b = 2\pi^2 a^2 b.$$

**13.6-misol.** Ushbu  $x = a(t - \sin t)$ ,  $y = a(1 - \cos t)$  ( $0 \leq t \leq 2\pi$ ) sikloida tar-mog'i bilan chegaralangan soha og'irlik markazining koordinatalarini toping.

**Yechilishi.** Yuqoridagi 9.5 - va 11.3 - misollar, hamda Guldinning ikkinchi teoremasiga asosan,

$$2\pi y_M \cdot S = 5a^3 \pi^2; \quad 2\pi y_M \cdot 3\pi a^2 = 5a^3 \pi^2, \quad y_M = \frac{5}{6}a,$$

sohaning simmetrikligidan,  $x_M = \pi a$ .

Shunday qilib,

$$M_x = \frac{a^3 \pi}{3} (\pi^2 - 6), \quad M_y = \frac{1}{3} \int_0^{\pi} a^3 \varphi \cos d\varphi = a^3 (4 - \pi^2), \\ S = \frac{1}{2} \int_0^{\pi} a^2 \varphi^2 d\varphi = \frac{a^2}{2} \cdot \frac{\pi^3}{3} = \frac{a^2 \pi^3}{6}$$

bo'ladi va

$$x_M = \frac{M_y}{S} = \frac{6a(4 - \pi^2)}{\pi^3} = 6(4 - \pi^2)a/\pi^3, \quad y_M = \frac{M_x}{S} = 2(\pi^2 - 6)a/\pi^2.$$

### Mustaqil yechish uchun misollar

Quyida berilgan chiziqlarning  $M_x$  va  $M_y$  statik momentlarini toping:

**13.1.**  $\frac{x}{a} + \frac{y}{b} = 1$ ,  $x \geq 0$ ,  $y \geq 0$ .

**13.2.**  $x^2 + y^2 = 4$ ,  $y \geq 0$ .

**13.3.**  $y = chx$ ,  $0 \leq x \leq 1$ .

**13.4.**  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ ,  $y \geq 0$ ,  $a > b$ .

**13.5.** Birinchi chorakda joylashgan  $x^{\frac{2}{3}} + y^{\frac{3}{2}} = a^{\frac{2}{3}}$  astroida yoyining koordinatalar o'qlariga nisbatan statik momentlarini toping.

**13.6.**  $y = \cos x$ ,  $\left(-\frac{\pi}{2} \leq x \leq \frac{\pi}{2}\right)$ , kosinusoidaning  $Ox$  o'qqa nisbatan statik momentini toping.

**13.7.**  $y = \sin x$ ,  $0 \leq x \leq \pi$ , sinusoidaning  $Ox$  o'qqa nisbatan statik momentini toping.

**13.8.** Ushbu  $y^2 = 2px \left(0 \leq x \leq \frac{p}{2}\right)$  parabola yoyining  $x = \frac{p}{2}$  to'g'ri chiziqqa nisbatan statik momentini toping.

Tenglamalari parametrik shaklda berilgan quyidagi chiziqning  $M_x$  va  $M_y$  statik momentlarini toping:

$$13.9. x = a \sin t, y = b \cos t, 0 \leq t \leq \frac{\pi}{2}, a > b (\rho = 1).$$

$$13.10. x = a \sin^3 t, y = a \cos^3 t, 0 \leq t \leq \frac{\pi}{2} (\rho = 1).$$

Qutb koordinatalar sistemasida berilgan chiziqning  $M_x$  va  $M_y$  statik momentlarini toping:

$$13.11. r = 2a \cos \varphi, 0 \leq \varphi \leq \frac{\pi}{2} (\rho = 1) \quad 13.12. \eta = a(1 + \cos \varphi), -\pi \leq \varphi \leq \pi (\rho = 1).$$

$$13.13. r = ae^\varphi, 0 \leq \varphi \leq 2\pi (\rho = 1).$$

Quyidagi berilgan chiziqlar og'irlik markazining  $x_M$  va  $y_M$  koordinatalarini toping:

$$13.14. x^2 + y^2 = 4, y \geq 0.$$

$$13.15. x^{2/3} + y^{2/3} = a^{2/3}, x \geq 0, y \geq 0.$$

$$13.16. y = a \operatorname{ch}(x/a), |x| \leq b.$$

$$13.17. x = \frac{1}{4} y^2 - \frac{1}{2} \ln y, 1 \leq y \leq 2.$$

$$13.18. x = a(t - \sin t), y = a(1 - \cos t), 0 \leq t \leq 2\pi.$$

$$13.19. r = a(1 + \cos \varphi), 0 \leq \varphi \leq \pi. \quad 13.20. r = ae^\varphi, \frac{\pi}{2} \leq \varphi \leq \pi.$$

**13.21.** Radiusi  $a$  ga teng bo'lgan yarim aylana og'irlik markazining koordinatalarini Guldin teoremasi yordamida toping.

Quyidagi berilgan chiziqlarning,  $Ox$  o'qqa nisbatan,  $I_x$  inersiya momentini toping:

$$13.22. y = \sqrt{r^2 - x^2}, -r \leq x \leq r.$$

$$13.23. y = e^x, 0 \leq x \leq 0,5.$$

$$13.24. y = 0,5a(e^{x/a} + e^{-x/a}), 0 \leq x \leq a.$$

$$13.25. x = R \cos \varphi, y = R \sin \varphi, 0 \leq \varphi \leq \alpha \leq 2\pi.$$

Quyidagi berilgan chiziqning, koordinatalar o'qlariga nisbatan,  $I_x$  va  $I_y$  inersiya momentlarini toping:

**13.26.**  $y = chx$ ,  $0 \leq x \leq 1$ .

**13.27.**  $x = a \cos^3 t$ ,  $y = a \sin^3 t$ ,  $0 \leq t \leq \frac{\pi}{2}$ .

**13.28.**  $x = a(t - \sin t)$ ,  $y = a(1 - \cos t)$ ,  $0 \leq t \leq 2\pi$ .

Quyida berilgan chiziqlar bilan chegaralangan tekis shakllarning  $M_x$  va  $M_y$  statik momentlarini toping:

**13.29.**  $x + y = 1$ ,  $x = 0$ ,  $y = 0$ .

**13.30.**  $y = \cos x$ ,  $|x| \leq \frac{\pi}{2}$ ,  $y = 0$ .

**13.31.**  $y = x^2$ ,  $y = \sqrt{x}$ .

**13.32.**  $y = \frac{2}{1+x^2}$ ,  $y = x^2$ ,  $x = 0$ ,  $x \geq 0$ .

**13.33.**  $x = a \cos t$ ,  $y = b \sin t$ ,  $-\frac{\pi}{2} \leq t \leq \frac{\pi}{2}$ ,  $y = 0$ .

**13.34.**  $x = a(t - \sin t)$ ,  $y = a(1 - \cos t)$ ,  $0 \leq t \leq 2\pi$ ,  $y = 0$ .

Quyidagi misollarda berilgan egri chiziqlar bilan chegaralangan sohaning grafigini chizing va og'irlik markazini toping:

**13.35.**  $y = 6x - x^2$ ,  $y = x$ .

**13.36.**  $x^2 = 4y$ ,  $x - 2y + 4 = 0$ .

**13.37.**  $y^3 = x^2$ ,  $2y = x$ .

**13.38.**  $y = x^2 - 2x$ ,  $y = 6x - x^2$ .

**13.39.**  $x + 1 = 0$ ,  $x + y^2 = 0$ .

**13.40.**  $y = 2x^2$  va  $y = 3 - x^2$  parabolalar bilan chegaralangan sohani qoplovchi yupqa tekis plastinkaning og'irlik markazini toping.

**13.41.** Birinchi chorakda,  $Oy$  o'q,  $y = \frac{x^2}{4}$  parabola va  $y = 4$  to'g'ri chiziq bilan chegaralangan «uchburchakli» sohani qoplovchi yupqa tekis plastinkaning og'irlik markazini toping.

**13.42.**  $x = a(t - \sin t)$ ,  $y = a(1 - \cos t)$ , sikloidaning bir arki va uning asosi bilan chegaralangan plastinkaning  $Ox$  o'qqa nisbatan statik momentini toping.

Quyidagi misollarda berilgan egri chiziqlar bilan chegaralangan sohaning og'irlik markazi koordinatalarini toping:

**13.43.**  $\frac{x^2}{a^2} + \frac{y^2}{b^2} \leq 1$  ( $0 \leq x \leq a$ ,  $0 \leq y \leq b$ ).

**13.44.**  $x^2 + 4y - 16 = 0$  va  $Ox$  o'q bilan chegaralangan.

**13.45.**  $y = \frac{2}{\pi} x$  to'g'ri chiziq va  $y = \sin x$  ( $x \geq 0$ ) .

**13.46.**  $x^2 + 4y^2 = 4$  va  $x^2 + y^2 = 4$  (birinchi chorakdagi qismi) .

**13.47.**  $y = h \left( 1 - \frac{x^2}{a^2} \right)$ ,  $y = 0$ ,  $h > 0$ ,  $a > 0$ .

**13.48.**  $y = \frac{2}{\pi} x$ ,  $y = \sin x$ ,  $y = 0$ .

**13.49.**  $y^2 = 2px$ ,  $x^2 = 2py$ .

**13.50.**  $\sqrt{x} + \sqrt{y} = \sqrt{a}$ ,  $x = 0$ ,  $y = 0$ .

**13.51.**  $y^2 = 2x$ ,  $x + y = 4$ .

**13.52.**  $y = x^3$ ,  $x + y = 2$ ,  $x = 0$ .

**13.53.**  $x = a(t - \sin t)$ ,  $y = a(1 - \cos t)$ ,  $0 \leq t \leq 2\pi$ ,  $y = 0$ .

Quyidagi qutb koordinatalar sistemasida berilgan egri chiziqlar bilan chegaralangan sohaning og'irlilik markazi koordinatalarini toping:

**13.54.**  $r = a \sin 2\phi$ ,  $0 \leq \phi \leq \frac{\pi}{2}$ .

**13.55.**  $r = a\phi$  ( $0 \leq \phi \leq \pi$ ) Arximed spirali va  $\phi = 0$ ,  $\phi = \pi$  nurlar bilan chegaralangan.

**13.56.**  $r = a(1 + \cos \phi)$  kardoida.

**13.57.**  $r^2 = a^2 \cos 2\phi$  – Bernulli lemniskatasining o'ng qismi.

**13.58.** Uchburchakning asosiga nisbatan inersiya momentini toping.

**13.59.** Tomonlari  $a$  ga teng bo'lgan kvadratning, uning diagonaliga nisbatan, inersiya momentini toping.

**13.60.** Asosi  $b$ , balandligi  $h$  bo'lgan ( $\rho = 1$ ) uchburchakning, asosiga nisbatan, statik va inersiya momentlarini toping.

**13.61.** Yarim o'qlari  $a$  va  $b$  bo'lgan, birjinsli ellipssimon plastinkaning, uning bosh o'qlariga nisbatan inersiya momentlarini toping ( $\rho = 1$ ).

**13.62.** Gulden teoremasidan foydalaniib,  $R$  radiusli yarim aylananing og'irlilik markazi koordinatalarini aniqlang.

**13.63.** Gulden teoremasidan foydalaniib, shar sirtning yuzini hisoblang.

**13.64.** Gulden teoremasidan foydalaniib, doiraviy konusning hajmi va yon sirtining yuzini hisoblang.

### Mustaqil yechish uchun misollarning javoblari

**13.1.**  $M_x = \frac{b\sqrt{a^2 + b^2}}{2}$ ,  $M_y = \frac{a\sqrt{a^2 + b^2}}{2}$ . **13.2.**  $M_x = 4$ ,  $M_y = 0$ .

**13.3.**  $M_x = 0,25(2 + sh2)$ ,  $M_y = sh1 - ch1 + 1$ . **13.4.**  $M_x = b\left(b + \frac{a}{\varepsilon} \operatorname{arcsin} \varepsilon\right)$ ,

$M_y = 0$ ,  $\varepsilon = \frac{\sqrt{a^2 - b^2}}{a}$  **13.5.**  $M_x = M_y = \frac{3}{5}a^2$ . **13.6.**  $M_x = \sqrt{2} + \ln(1 + \sqrt{2})$

## 14-§. Aniq integrallarni taqribiy hisoblash

Ushbu

$$\int_a^b f(x)dx \quad (14.1)$$

integralni hisoblash talab qilingan bo'lsin, bunda  $f(x)$  funksiya  $[a, b]$  kesmada uzluksiz, deb faraz qilinadi. Biz, yuqorida, aniq integralni hisoblash usullarini ko'rib o'tdik, lekin ba'zi fizik, mexanik masalalarni yechishda, integral ostidagi funksiyaning boshlang'ich funksiyasini elementar funksiyalar orqali ifodalab bo'lmaydigan integrallar uchraydi. Bunday integrallarni taqribiy hisoblashga to'g'ri keladi. Integrallarni taqribiy hisoblash uchun bir nechta formulalar mavjud bo'lib, biz quyida ularning ba'zilari bilan tanishamiz.

**14.1. To'g'ri to'rtburchaklar usuli.**  $[a, b]$  kesmaning, ixtiyoriy  $P = \{a = x_0 < x_1 < \dots < x_{2n} = b\}$  regulyar bo'linishini qaraymiz.  $[x_{2k-2}, x_{2k}]$  kesmaning o'rtaqidagi nuqtani  $x_{2k-1}$  orqali belgilaymiz (14.1-chizma). To'g'ri to'rtburchak usuli, (14.1) integralni, mos ravishda, balandliklari  $f(x_{2k-1})$ , asoslari esa,  $x_{2k} - x_{2k-2} = \frac{b-a}{n}$  ga teng bo'lgan, to'g'ri to'rtburchaklar yuzlarining,

$$\frac{b-a}{n}[f(x_1) + f(x_3) + \dots + f(x_{2n-1})]$$

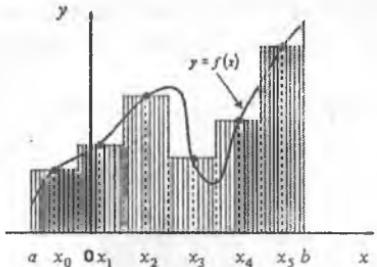

yig'indisiga taqribiy almashtirishdan iborat, ya'ni

$$\int_a^b f(x)dx \approx \frac{b-a}{n}[f(x_1) + f(x_3) + \dots + f(x_{2n-1})]. \quad (14.2)$$

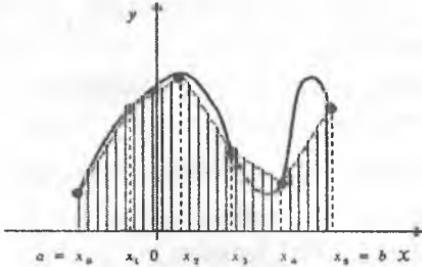

(14.2) formulaga, *to'g'ri to'rtburchak formulasi* deyiladi. Bu formulani, «qo'shimcha» had yordamida, ushbu

$$\int_a^b f(x)dx = \frac{b-a}{n}[f(x_1) + f(x_3) + \dots + f(x_{2n-1})] + R \quad (14.3)$$

ko'rinishda yozish mumkin, bunda  $R$  – qoldiq had.

14.1-chizma.

14.2-chizma.

Agar  $f(x)$  funksiya  $[a, b]$  kesmada uzlusiz ikkinchi tartibli hosilaga ega bo'lsa, u holda shu kesmada shunday  $\eta$  nuqta topiladi, (14.3) formula-dagi qoldiq had uchun,

$$R = \frac{(b-a)^3}{24n^2} f''(\eta)$$

tenlik o'rinni bo'ladi.

**14.2. Trapesiyalar usuli.** (14.1) integralni hisoblash talab qilingan bo'lsin.  $[a, b]$  kesmaning ixtiyoriy  $P = \{a = x_0 < x_1 < \dots < x_n = b\}$  regular bo'linishini olamiz va  $y = f(x)$  funksiyaning  $y_0 = f(x_0)$ ,  $y_1 = f(x_1)$ , ...,  $y_n = f(x_n)$  qiymatlarini hisoblaymiz. Trapesiyalar usuli, (14.1) integralni,

$$\frac{b-a}{2n} \{ [f(x_0) + f(x_1)] + [f(x_1) + f(x_2)] + \dots + [f(x_{n-1}) + f(x_n)] \} =$$

$$= \frac{b-a}{2n} \left\{ f(a) + f(b) + 2 \sum_{k=1}^{n-1} f(x_k) \right\}$$

yig'indiga, yoki asoslari, mos ravishda,  $f(x_{k-1})$  va  $f(x_k)$  larga, balandliklari  $x_k - x_{k-1} = \frac{b-a}{n}$  ga teng bo'lган, trapesiyalar yuzlarining yig'indisiga (14.2-chizma) taqrribiy almashtirishdan iborat, ya'ni

$$\int_a^b f(x) dx \approx \frac{b-a}{2n} \left\{ f(a) + f(b) + 2 \sum_{k=1}^n f(x_k) \right\}. \quad (14.4)$$

(14.4) formulani, qoldiq had yordamida,

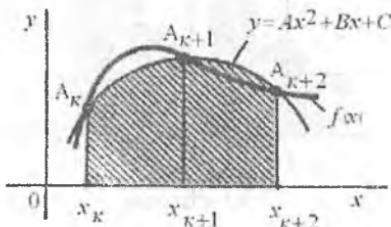

$$\int_a^b f(x) dx = \frac{b-a}{2n} \left\{ f(a) + f(b) + 2 \sum_{k=1}^n f(x_k) \right\} + R_w$$

ko'rinishda yozish mumkin, bunda  $R_w$  - qoldiq had. Agar  $f(x)$  funksiya  $[a, b]$  kesmada uzlusiz ikkinchi tartibli hosilaga ega bo'lsa, u holda,  $[a, b]$  kesmada shunday  $\eta$  nuqta topiladi,  $R_w$  uchun,

$$R_w = -\frac{(b-a)^3}{12n^2} f''(\eta), \quad a \leq \eta \leq b,$$

tenglik o'rinni bo'ladi.

**14.3. Parabolalar usuli.** (14.1) integralni hisoblash uchun,  $[a, b]$  kesmaning ixtiyoriy  $P = \{a = x_0 < x_1 < \dots < x_{2n} = b\}$  regular bo'linishini olamiz.  $[x_{2k-2}, x_{2k}]$  kesmaning o'rtaсидаги nuqtani  $x_{2k-1}$  orqали belgilaymиз:  $x_{2k-1} = \frac{x_{2k-2} + x_{2k}}{2}$ ,  $k = \overline{1, n}$ . Parabolalar usulida berilgan (14.1) integral,  $f(x)$  funksiya grafigining, absissalari  $x_{2k-2}$ ,  $x_{2k-1}$  va  $x_{2k}$  bo'lgan nuqtalardan o'tuvchi parabolalar ostida joylashgan trapesiyalar yuzlarining

14.3-chizma.

$$\frac{b-a}{6n} \{ [f(x_0) + 4f(x_1) + f(x_2)] + [f(x_2) + 4f(x_3) + f(x_4)] + \dots +$$

$$+ [f(x_{2n-2}) + 4f(x_{2n-1}) + f(x_{2n})] \} = \frac{b-a}{6n} \{ f(a) + f(b) + 2 \sum_{k=1}^{n-1} f(x_{2k}) + 4 \sum_{k=0}^{n-1} f(x_{2k+1}) \}$$

yig'indisiga taqrifiy almashtiriladi, ya'ni:

$$\int_a^b f(x) dx \approx \frac{b-a}{6n} \{ [f(x_0) + 4f(x_1) + f(x_2)] + [f(x_2) + 4f(x_3) + f(x_4)] + \dots + [f(x_{2n-2}) + 4f(x_{2n-1}) + f(x_{2n})] \} = \frac{b-a}{6n} \{ f(a) + f(b) + 2 \sum_{k=1}^{n-1} f(x_{2k}) + 4 \sum_{k=0}^{n-1} f(x_{2k+1}) \}$$

yoki

$$\int_a^b f(x) dx = \frac{b-a}{6n} \{ f(a) + f(b) + 2 \sum_{k=1}^{n-1} f(x_{2k}) \} + 4 \sum_{k=0}^{n-1} f(x_{2k+1}) + R_{pa}, \quad (14.5)$$

bunda,  $R_{pa}$  – qoldiq had.

Agar  $f(x)$  funksiya  $[a, b]$  kesmada uzliksiz to'rtinchi tartibli hosilaga ega bo'lsa, u holda  $[a, b]$  kesmada shunday nuqta topiladiki, (14.5) formuladagi had  $R_{pa}$  – uchun,

$$R_{pa} = -\frac{(b-a)^5}{2880n^4} f^{(4)}(\eta), \quad a \leq \eta \leq b,$$

tenglik o'rini bo'ladi. (14.4) formulaga, *parabolalar (Simpson) formulası* deyiladi (14.3-chizma).

**14.1- misol.** Ushbu

$$\int_1^9 \sqrt{5x+4} dx$$

integralni, integrallash oralig'ini, 8 ta o'zaro teng bo'lakka bo'lib:  
1) Nyuton - Leybnis; 2) to'g'ri to'rburchaklar; 3) trapesiyalar va

4) parabolalar formulalari yordamida hisoblang, so‘ngra taqribi y hisoblash formulasida qo‘yilgan absolyut va nisbiy xatolarni foizlarda toping.

**Yechilishi.** 1) Berilgan integralni, Nyuton – Leybnis formulasiga asosan, hisoblaymiz:

$$J = \int_1^9 \sqrt{5x+4} dx = \frac{1}{5} \int_1^9 (5x+4)^{1/2} d(5x+4) = \frac{2}{15} (5x+4)^{3/2} \Big|_1^9 = \frac{2}{15} (343 - 27) = \frac{632}{15} = 42 \frac{2}{15}.$$

2) To‘g‘ri to‘rtburchaklar formulasini bo‘yicha hisoblaymiz: [1; 9] kesmaning,  $P = \{1 = x_0 < x_1 < \dots < x_8 = 9\}$  regular bo‘linishini qaraymiz.  $y = f(x) = \sqrt{5x+4}$  funksiyaning, bu kesmalarning o‘rtalaridagi qiymatlarini hisoblaymiz:  $x_{2k-1} = \frac{x_{2k-2} + x_{2k}}{2}$  ( $k = 1, 8$ );

$$x_1 = \frac{3}{2}, \quad f(x_1) = f\left(\frac{3}{2}\right) = \sqrt{\frac{23}{2}} = 3,3911,$$

$$x_3 = \frac{5}{2}, \quad f(x_3) = f\left(\frac{5}{2}\right) = \sqrt{\frac{33}{2}} = 4,0620,$$

$$x_5 = \frac{7}{2}, \quad f(x_5) = f\left(\frac{7}{2}\right) = \sqrt{\frac{43}{2}} = 4,6368,$$

$$x_7 = \frac{9}{2}, \quad f(x_7) = f\left(\frac{9}{2}\right) = \sqrt{\frac{53}{2}} = 5,1478,$$

$$x_9 = \frac{11}{2}, \quad f(x_9) = f\left(\frac{11}{2}\right) = \sqrt{\frac{63}{2}} = 5,6124$$

$$x_{11} = \frac{13}{2}, \quad f(x_{11}) = f\left(\frac{13}{2}\right) = \sqrt{\frac{73}{2}} = 6,0415,$$

$$x_{13} = \frac{15}{2}, \quad f(x_{13}) = f\left(\frac{15}{2}\right) = \sqrt{\frac{83}{2}} = 6,4420,$$

$$x_{15} = \frac{17}{2}, \quad f(x_{15}) = f\left(\frac{17}{2}\right) = \sqrt{\frac{93}{2}} = 6,8190.$$

Har bir kesmaning uzunligi  $h = \frac{9-1}{8} = 1$ . Funksiyaning topilgan qiymatlarini (14.2) to‘g‘ri turtburchaklar formulasiga keltirib qo‘yib, hisoblaymiz:

$$J_1 = \int_1^9 \sqrt{5x+4} dx = \frac{632}{15} \approx \sqrt{\frac{23}{2}} + \sqrt{\frac{33}{2}} + \sqrt{\frac{43}{2}} + \sqrt{\frac{53}{2}} + \sqrt{\frac{63}{2}} + \sqrt{\frac{73}{2}} + \sqrt{\frac{83}{2}} + \sqrt{\frac{93}{2}} = 42,1526.$$

Taqribiy hisoblashlardagi absolyut xato:

$$\Delta = |J - J_1| = \left| \frac{632}{15} - 42,1526 \right| = |42,1333 - 42,1526| = 0,0193.$$

Nisbiy xato (foizlarda):  $\delta = \frac{\Delta}{J} \cdot 100\% = \frac{15 \cdot 0,0193 \cdot 100}{632} \approx 0,0458\%$ .

3) Trapesiyalar formulasini bo‘yicha hisoblaymiz:

$a = x_0 = 1$	$b = x_8 = 9$
$a = x_0 = 1$	$f(a) = f(1) = 3$
$x_1 = 2$	$f(x_1) = f(2) = \sqrt{14} = 3,7416$
$x_2 = 3$	$f(x_2) = f(3) = \sqrt{19} = 4,3588$
$x_3 = 4$	$f(x_3) = f(4) = \sqrt{24} = 4,8989$
$x_4 = 5$	$f(x_4) = f(5) = \sqrt{29} = 5,3851$
$x_5 = 6$	$f(x_5) = f(6) = \sqrt{34} = 5,8309$
$x_6 = 7$	$f(x_6) = f(7) = \sqrt{39} = 6,2449$
$x_7 = 8$	$f(x_7) = f(8) = \sqrt{44} = 6,6332$
$b = x_8 = 9$	$f(x_8) = f(9) = 7$

Funksiyaning topilgan qiymatlarini (14.4) formulaga keltirib qo'yib, hisoblaymiz:

$$J_2 = \frac{632}{15} \approx \frac{1}{2}[3 + 7 + 2(\sqrt{14} + \sqrt{19} + \sqrt{24} + \sqrt{29} + \sqrt{34} + \sqrt{39} + \sqrt{44})] = 5 + 37,0924 = 42,0934.$$

$$\text{Absolyut xato: } \Delta = |J - J_2| = \left| \frac{632}{15} - 42,0934 \right| = 42,1333 - 42,0934 = 0,0399.$$

$$\text{Nisbiy xato (foizlarda): } \delta = \frac{\Delta}{J} \cdot 100\% = \frac{15 \cdot 0,0399 \cdot 100\%}{632} \approx 0,0946\%.$$

4) Parabolalar formulasi bo'yicha hisoblaymiz:

$x_2 = 2$ ,	$f(x_2) = f(2) = \sqrt{14}$ ,
$x_4 = 3$ ,	$f(x_4) = f(3) = \sqrt{19}$ ,
$x_6 = 4$ ,	$f(x_6) = f(4) = \sqrt{24}$ ,
$x_8 = 5$ ,	$f(x_8) = f(5) = \sqrt{29}$ ,
$x_{10} = 6$ ,	$f(x_{10}) = f(6) = \sqrt{34}$ ,
$x_{12} = 7$ ,	$f(x_{12}) = f(7) = \sqrt{39}$ ,
$x_{14} = 8$ ,	$f(x_{14}) = f(8) = \sqrt{44}$ ,

Topilgan qiymatlarni (14.5) formulaga keltirib qo'yib, hisoblaymiz:

$$\begin{aligned} J_3 &= \frac{632}{15} \approx \frac{1}{2}[3 + 7 + 2(\sqrt{14} + \sqrt{19} + \sqrt{24} + \sqrt{29} + \sqrt{34} + \sqrt{39} + \sqrt{44}) + \\ &+ 4 \left( \sqrt{\frac{23}{2}} + \sqrt{\frac{33}{2}} + \sqrt{\frac{43}{2}} + \sqrt{\frac{53}{2}} + \sqrt{\frac{63}{2}} + \sqrt{\frac{73}{2}} + \sqrt{\frac{83}{2}} + \sqrt{\frac{93}{2}} \right)] = \frac{1}{6}[10 + 2 \cdot 37,0934 + 4 \cdot 42,1526] = \\ &= \frac{10 + 74,1868 + 168,6104}{6} = 42,1328. \end{aligned}$$

$$\text{Absolyut xato: } \Delta = |J - J_3| = 42,1333 - 42,1328 = 0,0005.$$

$$\text{Nisbiy xato (foizlarda): } \delta = \frac{\Delta}{J} \cdot 100\% = \frac{15 \cdot 0,0005 \cdot 100\%}{632} \approx 0,0111\%.$$

**14.2-misol.** Ushbu  $\int_{-2}^0 (x^2 - 1)dx$  integralning qiymatini: 1) trapesiyalar usuli ( $n = 4$ ); 2) Simpson usuli ( $n = 4$ ), bo'yicha yaqinlashishlar bajarib, hisoblang.

**Yechilishi.** 1). Trapesiyalar usulidan foydalanish:

a)  $f(x) = x^2 - 1$ ,  $[a, b] = [-2, 0]$ ,  $n = 4$  bo'lgani uchun,  $[-2, 0]$  kesmaning

$P = \left\{ -2, -\frac{3}{2}, -1, \frac{1}{2}, 0 \right\}$  regular bo'linishini qaraymiz, hamda bo'linish

nuqtalarida funksiyaning qiymatlarini hisoblaymiz:

$$f(-2) = 3; f\left(-\frac{3}{2}\right) = \frac{5}{4}; f(-1) = 0; f\left(-\frac{1}{2}\right) = -\frac{3}{4}; f(0) = -1$$

Unda

$$\begin{aligned} \int_{-2}^0 (x^2 - 1)dx &\equiv \frac{2}{2 \cdot 4} \left\{ f(-2) + f(0) + 2[f\left(-\frac{3}{2}\right) + f(-1) + f\left(-\frac{1}{2}\right)] \right\} = \\ &= \frac{1}{4} \left\{ 3 - 1 + 2 \cdot \left[ \frac{5}{4} + 0 - \frac{3}{4} \right] \right\} = \frac{1}{4} \{2 + 1\} = \frac{3}{4} = 0,75. \end{aligned}$$

Endi  $f''(\eta) = 2$ ,  $h = \frac{1}{2}$  ekanligidan foydalansak,

$$|R_v| \leq \frac{2}{12} \cdot \frac{1}{4} \cdot 2 = \frac{1}{12} \approx 0,08$$

bo'ladi.

b) Integralni bevosita hisoblaymiz:

$$\int_{-2}^0 (x^2 - 1)dx = \int_2^0 x^2 dx - \int_{-2}^0 dx = \frac{x^3}{3} \Big|_2^0 - x \Big|_{-2}^0 = 0 - \left( \frac{-8}{3} \right) - (0 - (-2)) = \frac{8}{3} - 2 = \frac{2}{3} \approx 0,67.$$

Demak,  $|R_v| = |0,67 - 0,75| = 0,08$ .

c) Taqrifiy hisoblashdagi absolyut xato va nisbiy xatolarni (foizlarda) topamiz:

$$\Delta = \left| \frac{2}{3} - \frac{3}{4} \right| = \left| \frac{8-9}{12} \right| = \left| -\frac{1}{12} \right| = \frac{1}{12}, \quad \delta = \frac{3 \cdot \frac{1}{12}}{2} 100\% = \frac{1}{8} 100\% = 0,125\%.$$

Demak, I. a) 0,75; 0,08, b)  $\frac{2}{3}$ ; 0,08, c) 0,125%.

2). Simpson usulidan foydalanish: a)  $\int_{-2}^0 (x^2 - 1)dx$  integralning taqrifiy

qiymatini, Simpson usuli bo'yicha hisoblash uchun, bizga, funksiyaning, bo'linishda hosil bo'lgan nuqtalardagi qiymatlaridan tashqari,  $[x_{i-1}, x_i]$ ,  $i = 1, 2, 3, 4$ , qism kesmalar,

$$[-2, -\frac{3}{2}], [-\frac{3}{2}, -1], [1, -\frac{1}{2}], [-\frac{1}{2}, 0]$$

ning o'rta nuqtalari bo'lgan,  $\xi_1 = -\frac{7}{4}$ ;  $\xi_2 = -\frac{5}{4}$ ;  $\xi_3 = -\frac{3}{4}$ ;  $\xi_4 = -\frac{1}{4}$  nuqtalarda funksiyaning  $f(\xi_1) = \frac{33}{16}$ ;  $f(\xi_2) = \frac{9}{16}$ ;  $f(\xi_3) = -\frac{7}{16}$ ;  $f(\xi_4) = -\frac{15}{16}$  qiymatlari kerak bo'ladi. Unda

$$\begin{aligned} \int_{-2}^0 (x^2 - 1) dx &\approx \frac{2}{6 \cdot 4} \{f(-2) + f(0) + 2[f(\frac{3}{2}) + f(-1)] + \\ &+ 4[f(-\frac{7}{4}) + f(-\frac{5}{4}) + f(-\frac{3}{4}) + f(-\frac{1}{4})]\} = \\ &= \frac{1}{12} \{3 - 1 + 2[\frac{5}{4} + 0 - \frac{3}{4}] + 4[\frac{33}{16} + \frac{9}{16} - \frac{7}{16} - \frac{15}{16}]\} = \frac{1}{12} \{2 + 2 \cdot \frac{1}{2} + 4 \cdot \frac{33+9-7-15}{16}\} = \frac{2}{3}. \\ |R_e| &\leq \frac{2}{180} \cdot \frac{1}{2^4} \cdot f^{(IV)}(\eta) = 0 \Rightarrow R_e = 0. \end{aligned}$$

b) Integralni bevosita hisoblaymiz:  $\int_{-2}^0 (x^2 - 1) dx = \frac{2}{3}$ .

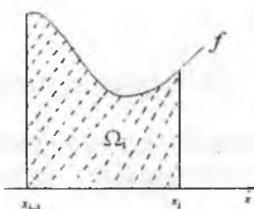

Demak,  $|R_e| = \left| \frac{2}{3} - \frac{2}{3} \right| = 0$ .

c) Taqribiy hisoblashdagи absolют xato va nisbiy xatolarni (foizlarda) topamiz: 0%. Demak, 2) a)  $\frac{2}{3}$ ; b)  $\frac{2}{3}$ ; c) 0%.

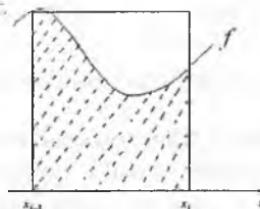

Yana biz ushbu  $\int_a^b f(x) dx$  integralni qaraymiz, bunda  $f$  funksiyani  $[a, b]$  da uzluksiz va chizmada qulay bo'lishi uchun, uni musbat funksiya, deb faraz qilamiz.  $[a, b]$  kesmada regular  $P = \{x_0, x_1, x_2, \dots, x_{n-1}, x_n\}$  bo'linish olamiz, u berilgan kesmani bir xil  $\frac{b-a}{n}$  uzunlikdagi  $n$  ta qism kesmalarga bo'ladi:

$$[a, b] = [x_0, x_1] \cup \dots \cup [x_{i-1}, x_i] \cup \dots \cup [x_{n-1}, x_n], \Delta x_i = x_i - x_{i-1} = \frac{b-a}{n}.$$

14.3-chizmadagi  $\Omega_i$ , soha bir necha usullar bilan yaqinlashtirilishi mumkin:

14.3-chizma

14.4-chizma.

$$\frac{0,1989}{n^2} < 0,001$$

tengsizlik yoki

$$n^2 > \frac{0,199}{0,001} = 199$$

bo'lishi, ya'ni  $n > 14$ ;  $n \geq 15$  bo'lishini olamiz.

Demak, trapesiyalar qoidasi bo'yicha yaqinlashish bajarilganda, absolyut xato  $\varepsilon = 0,001$  dan kichik bo'lishini kafolatlash uchun, [1, 4] kesmani, kamida 15 ta qism bo'laklarga bo'lish lozim bo'ladi.

2) Simpson qoidasi bo'yicha yaqinlashish bajarilganda,  $n$  ning, qoldiq

$$|R_\varepsilon| < \varepsilon = 0,001$$

bo'lishini ta'minlaydigan qiymatini topamiz.  $h = \frac{3}{4}$ ;  $\eta = 2$  bo'lsin. U holda,

$$f^{(IV)}(\eta) = f^{(IV)}(2) = -0,0828.$$

Demak,

$$|R_\varepsilon| \leq \frac{3}{12} \cdot \left(\frac{3}{n}\right)^4 \cdot 0,0828 = \frac{1}{4} \left(\frac{3}{n}\right)^4 \cdot 0,0838 < \varepsilon$$

yoki

$$\frac{81}{4} \cdot \frac{1}{n^4} 0,0838 < 0,001$$

bo'lishi talab qilinadi. Bu yerdan,

$$\frac{1,68}{n^4} < 0,001, \quad n^4 > \frac{1,681}{0,001} = 1681 \Rightarrow n > 6$$

bo'lishini olamiz. Demak,  $n \geq 7$ .

### Mustaqil yechish uchun misollar

Quyidagi integralni berilgan qadamda to'g'ri to'rtburchak formulasi yordamida taqrifiy hisoblang:

$$14.1. \int_0^2 x^4 dx, h = 0,2.$$

$$14.2. \int_1^5 \frac{dx}{1+x^4}, h = 0,5.$$

$$14.3. \int_0^2 e^{-x^2} dx, h = 0,2.$$

$$14.4. \int_0^1 \frac{\ln(1+x)}{x} dx, h = 0,2.$$

Quyidagi integralni berilgan qadamda trapesiyalar formulasi yordamida hisoblang:

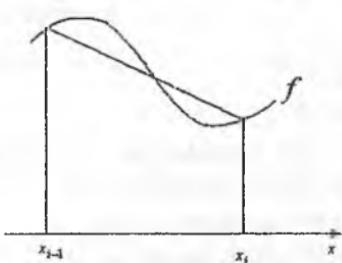

$$14.5. \int_2^7 \frac{dx}{\sqrt{x+2}}, h = 1.$$

$$14.6. \int_0^1 x \sqrt{1-x^2} dx, h = 0,1.$$

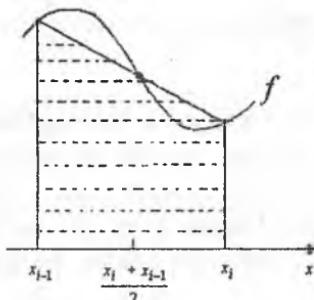

$$14.7. \int_0^2 \sqrt{1+x^4} dx, h = \frac{1}{8}.$$

$$14.8. \int_0^1 \frac{dx}{1+x^2}, h = 0,1.$$

$$yuza = \frac{1}{6} [f(x_{i-1}) + 4f\left(\frac{x_{i-1} + x_i}{2}\right) + f(x_i)] \Delta x_i = [f(x_{i-1}) + 4f\left(\frac{x_{i-1} + x_i}{2}\right) + f(x_i)] \frac{b-a}{6n}$$

14.8-chizma.

14.9-chizma

Ravshanki, agar bu uchta nuqtalar bir to‘g‘ri chiziqda yotsa, parabola yoyi to‘g‘ri chiziqqa aylanadi va parabolik soha trapesiyali soha (4-hol) ga keltiriladi.

Shunday qilib,  $\Omega$ , sohani biz yuqorida ko‘rib o‘tgan yaqinlashtirishlar  $\int_a^b f(x)dx$  integral qiymatining quyidagi yaqinlashishlariga olib keladi.

- Chap chetki nuqta orqali yaqinlashish:

$$Z_n = \frac{b-a}{n} [f(x_0) + f(x_1) + \dots + f(x_{n-1})]. \quad (14.6)$$

- O’ng chetki nuqta orqali yaqinlashish:

$$R_n = \frac{b-a}{n} [f(x_1) + f(x_2) + \dots + f(x_n)]. \quad (14.7)$$

- O’rta nuqta bo‘yicha yaqinlashish:

$$M_n = \frac{b-a}{n} [f\left(\frac{x_0 + x_1}{2}\right) + f\left(\frac{x_1 + x_2}{2}\right) + \dots + f\left(\frac{x_{n-1} + x_n}{2}\right)]. \quad (14.8)$$

- Trapesiya bo‘yicha yaqinlashish (trapesiyalar qoidasi):

$$\begin{aligned} T_n &= \frac{b-a}{n} \left[ \frac{f(x_0) + f(x_1)}{2} + \frac{f(x_1) + f(x_2)}{2} + \dots + \frac{f(x_{n-1}) + f(x_n)}{2} \right] = \\ &= \frac{b-a}{2n} [f(x_0) + 2f(x_1) + \dots + 2f(x_{n-1}) + f(x_n)]. \end{aligned} \quad (14.9)$$

- Parabola bo‘yicha yaqinlashish (Simpson qoidasi):

$$\begin{aligned} S_n &= \frac{b-a}{6n} \left\{ [f(x_0) + f(x_n) + 2(f(x_1) + f(x_2) + \dots + f(x_{n-1})) + \right. \\ &\quad \left. + 4(f\left(\frac{x_0 + x_1}{2}\right) + \dots + f\left(\frac{x_{n-1} + x_n}{2}\right))] \right\} \end{aligned} \quad (14.10)$$

Bu yaqinlashishlarning dastlabki uchtasi, ya'ni  $Z_n$ ,  $R_n$  va  $M_n$  lar Riman yig'indilari bo'lib,  $T_n$  va  $S_n$  lar esa, Riman yig'indilari sifatida yozilishi mumkin.

**14.3-misol.** Ushbu  $\int_0^3 \sqrt{4+x^3} dx$  integralning taqrifiy qiymatlarini,  $n=6$  deb olib: a)chap chetki nuqta orqali yaqinlashish; b)o'ng chetki nuqta bo'yicha; c) o'rta nuqta bo'yicha; d) trapesiya bo'yicha (trapesiya qoidasi); e)parabola (Simpson qoidasi) bo'yicha yaqinlashishlarini toping.

**Yechilishi.**  $n=6$  bo'lganda har bir  $[x_{i-1}, x_i]$  qism kesmaning uzunligi,  $\frac{b-a}{n} = \frac{3-0}{6} = \frac{1}{2}$  ga teng bo'ladi. Bo'linish nuqtalari

$$x_0 = 0; x_1 = \frac{1}{2}, x_2 = 1, x_3 = \frac{3}{2}, x_4 = 2, x_5 = \frac{5}{2}, x_6 = 3$$

$f(x) = \sqrt{4+x^3}$  funksiyaning bu bo'linish nuqtalaridagi qiymatlarini hisoblaymiz:  $f(0) = 2$ ;  $f\left(\frac{1}{2}\right) \approx 2,031$ ;  $f(1) \approx 2,236$ ;  $f\left(\frac{3}{2}\right) \approx 2,716$ ;  $f(2) \approx 3,464$ ;

$f\left(\frac{5}{2}\right) \approx 4,430$ ,  $f(3) \approx 5,568$  (bu erda hisoblashlar uchta o'nliklar xonasigacha yaxlitlangan). Unda

$$\begin{aligned} a) Z_6 &= \frac{1}{2}[f(0) + f\left(\frac{1}{2}\right) + f(1) + f\left(\frac{3}{2}\right) + f(2) + f\left(\frac{5}{2}\right)] \approx \\ &\approx \frac{1}{2}[2,000 + 2,031 + 2,236 + 2,716 + 3,464 + 4,430] = \frac{1}{2} \cdot 16,877 = 8,4385. \end{aligned}$$

$$\begin{aligned} b) R_6 &= \frac{1}{2}[f\left(\frac{1}{2}\right) + f(1) + f\left(\frac{3}{2}\right) + f(2) + f\left(\frac{5}{2}\right) + f(3)] \approx \\ &\approx \frac{1}{2}[2,031 + 2,236 + 2,716 + 3,464 + 4,430 + 5,568] = \frac{1}{2} \cdot 20,445 = 10,2225. \end{aligned}$$

c)  $[x_{i-1}, x_i]$  qism kesmalarning ( $i = 1, 2, 3, 4, 5, 6$ ) o'rta nuqtalarini topamiz:

$$\frac{x_0 + x_1}{2} = \frac{0+0,5}{2} = \frac{1}{4}, \quad \frac{x_1 + x_2}{2} = \frac{0,5+1}{2} = \frac{3}{4}, \quad \frac{x_2 + x_3}{2} = \frac{1+1,5}{2} = \frac{5}{4},$$

$$\frac{x_3 + x_4}{2} = \frac{1,5+2}{2} = \frac{7}{4}, \quad \frac{x_4 + x_5}{2} = \frac{2+2,5}{2} = \frac{9}{4}, \quad \frac{x_5 + x_6}{2} = \frac{2,5+3}{2} = \frac{11}{4}.$$

Topilgan nuqtalarda  $f(x) = \sqrt{4+x^3}$  funksiyaning qiymatlarini hisoblaymiz (bu erda ham hisoblashlarni uchta o'nliklar xonasigacha yaxlitlaymiz):

$$f\left(\frac{1}{4}\right) = 2,004; f\left(\frac{3}{4}\right) = 2,103; f\left(\frac{5}{4}\right) = 2,439; f\left(\frac{7}{4}\right) = 3,059; f\left(\frac{9}{4}\right) = 3,923; f\left(\frac{11}{4}\right) = 4,980$$

yaqinlashishlar bajarib, hisoblang. Natijalarni, integrallashni bajarib, tekshiring (solishtiring).

**14.43.** Ushbu  $\int_0^1 \sin^2 \pi x dx$  integralning qiymatini: *a)* chap chekti nuqta bo'yicha ( $n=3$  deb olib); *b)* o'ng chetki nuqta bo'yicha ( $n=3$  deb olib); *c)* trapesiyalar qoidasi bo'yicha ( $n=6$  deb olib); *d)* Simpson qoidasi bo'yicha ( $n=3$  deb olib) yaqinlashishlar bajarib, hisoblang. Natijalarni integrallashni bajarib, tekshiring (solishtiring).

**14.44.** Ushbu  $\int_0^1 \frac{dx}{1+x^2}$  integralning qiymatini: *a)* trapesiyalar qoidasi ( $n=4$  deb olib); *b)* Simpson qoidasi ( $n=4$  deb olib) bo'yicha yaqinlashishlar bajarib, hisoblang:

**14.45.** Ushbu  $\int_{-1}^1 \cos x^2 dx$  integralning qiymatini: *a)* o'rta nuqta bo'yicha ( $n=4$  deb olib); *b)* trapesiyalar qoidasi bo'yicha ( $n=8$  deb olib); *c)* Simpson qoidasi bo'yicha ( $n=4$  deb olib) yaqinlashishlar bajarib, hisoblang.

**14.46.** Ushbu  $\int_0^2 e^{-x^2} dx$  integralning qiymatini: *a)* trapesiyalar qoidasi ( $n=10$  deb olib); *b)* Simpson qoidasi ( $n=5$  deb olib) bo'yicha yaqinlashishlar bajarib, hisoblang.

Quyidagi misollarda, integralning qiymatini: *a)* trapesiyalar qoidasi bo'yicha; *b)* Simpson qoidasi bo'yicha yaqinlashtirishlar bajarib hisoblaganda  $n$  ning absolyut xato berilgan  $\varepsilon$  dan kichik bo'lishini kafolatlaydigan qiymatini toping:

$$14.47. \int_1^4 \sqrt{x} dx, \quad \varepsilon = 0,01.$$

$$14.48. \int_1^4 \sqrt{x} dx, \quad \varepsilon = 0,00001.$$

$$14.49. \int_0^5 \sin x dx, \quad \varepsilon = 0,001.$$

$$14.50. \int_1^3 e^x dx, \quad \varepsilon = 0,01.$$

$$14.51.5) \int_0^2 e^{-x^2} dx, \quad \varepsilon = 0,0001.$$

### Mustaqil yechish uchun misollarning javoblari

**14.1.** 6,37. **14.2.** 0,23. **14.3.** 16,1. **14.4.** 0,822. **14.5.** 2,002.

**14.6.** 0,3296. **14.7.** 3,482. **14.8.** 0,8350. **14.9.** 2,4859. **14.10.** 16,5.

**14.11.** 0,8821. **14.12.** 5,4024. **14.13.**  $0 < R < 0,16$ .

$$\frac{0,1989}{n^2} < 0,001$$

tengsizlik yoki

$$n^2 > \frac{0,199}{0,001} = 199$$

bo‘lishi, ya’ni  $n > 14$ ;  $n \geq 15$  bo‘lishini olamiz.

Demak, trapesiyalar qoidasi bo‘yicha yaqinlashish bajarilganda, absolyut xato  $\varepsilon = 0,001$  dan kichik bo‘lishini kafolatlash uchun, [1, 4] kesmani, kamida 15 ta qism bo‘laklarga bo‘lish lozim bo‘ladi.

2) Simpson qoidasi bo‘yicha yaqinlashish bajarilganda,  $n$  ning, qoldiq

$$|R_c| < \varepsilon = 0,001$$

bo‘lishini ta’minlaydigan qiymatini topamiz.  $h = \frac{3}{4}$ ;  $\eta = 2$  bo‘lsin. U holda,

$$f^{(IV)}(\eta) = f^{(IV)}(2) = -0,0828.$$

Demak,

$$|R_c| \leq \frac{3}{12} \left( \frac{3}{n} \right)^4 \cdot 0,0828 = \frac{1}{4} \left( \frac{3}{n} \right)^4 \cdot 0,0838 < \varepsilon$$

yoki

$$\frac{81}{4} \cdot \frac{1}{n^4} 0,0838 < 0,001$$

bo‘lishi talab qilinadi. Bu yerdan,

$$\frac{1,68}{n^4} < 0,001, \quad n^4 > \frac{1,68}{0,001} = 1681 \Rightarrow n > 6$$

bo‘lishini olamiz. Demak,  $n \geq 7$ .

### Mustaqil yechish uchun misollar

Quyidagi integralni berilgan qadamda to‘g‘ri to‘rtburchak formulasi yordamida taqrribiy hisoblang:

$$14.1. \int_0^2 x^4 dx, h = 0,2.$$

$$14.2. \int_1^5 \frac{dx}{1+x^4}, h = 0,5.$$

$$14.3. \int_0^{\pi/2} e^{x^2} dx, h = 0,2.$$

$$14.4. \int_0^1 \frac{\ln(1+x)}{x} dx, h = 0,2.$$

Quyidagi integralni berilgan qadamda trapesiyalar formulasi yordamida hisoblang:

$$14.5. \int_2^7 \frac{dx}{\sqrt{x+2}}, h = 1.$$

$$14.6. \int_0^1 x \sqrt{1-x^2} dx, h = 0,1.$$

$$14.7. \int_0^2 \sqrt{1+x^4} dx, h = \frac{1}{8}.$$

$$14.8. \int_0^1 \frac{dx}{1+x^2}, h = 0,1.$$

Quyidagi integralni berilgan qadamda Simpson formulasi yordamida taqribiy hisoblang:

$$14.9. \int_1^3 \sqrt{\frac{x+1}{x}} dx, h = 0,5.$$

$$14.10. \int_0^1 e^{x^2} dx, h = 0,2.$$

$$14.11. \int_0^2 e^{-x^2} dx, h = 0,5.$$

$$14.12. \int_0^{\pi} \sqrt{3 + \cos x} dx, h = \pi/6.$$

Quyidagi integral uchun berilgan qadamda to‘g‘ri to‘rtburchak formulasi yordamida absolyut xatoni hisoblang:

$$14.13. \int_0^2 x^4 dx, h = 0,2.$$

$$14.14. \int_0^{\pi} \sin x dx, h = \pi/6.$$

$$14.15. \int_1^5 \frac{dx}{x}, h = 0,4.$$

$$14.16. \int_1^3 \frac{\sqrt{x+1}}{x} dx, h = 0,25.$$

Quyidagi integral uchun berilgan qadamda trapesiya formulasi yordamida absolyut xatoni hisoblang:

$$14.17. \int_2^9 \frac{dx}{x-1}, h = 1.$$

$$14.18. \int_0^1 \frac{dx}{1+x^3}, h = \frac{1}{3}.$$

$$14.19. \int_2^7 \frac{dx}{\sqrt{x+2}}, h = 1.$$

$$14.20. \int_2^5 \ln^2 x dx, h = 0,5.$$

Quyidagi integral uchun berilgan qadamda Simpson formulasi yordamida absolyut xatoni hisoblang:

$$14.21. \int_0^{\pi/2} \cos \frac{x}{2} dx, h = \frac{\pi}{8}.$$

$$14.22. \int_1^3 \ln 2x dx, h = \frac{1}{3}.$$

$$14.23. \int_0^6 x \ln(4+x) dx, h = \frac{1}{4}.$$

$$14.24. \int_2^5 \frac{dx}{\ln x}, h = 0,5.$$

Quyidagi integralni to‘g‘ri to‘rtburchak formulasi yordamida hisoblaganda, yo‘l qo‘yilgan xatoning berilgan  $\varepsilon$  dan oshmasligi uchun  $h$  qadam qanday bo‘lishi kerak?

$$14.25. \int_0^2 x^4 dx, \varepsilon = 10^{-2}.$$

$$14.26. \int_0^{\pi/3} \cos 2x dx, \varepsilon = 10^{-3}.$$

$$14.27. \int_0^3 \ln(1+x^2) dx, \varepsilon = 10^{-4}.$$

$$14.28. \int_0^1 \sqrt{1+x^3} dx, \varepsilon = 10^{-3}.$$

Quyidagi integralni trapesiya formulasi yordamida hisoblaganda yo‘l qo‘yilgan xatoning berilgan  $\varepsilon$  dan oshmasligi uchun  $h$  qadam qanday bo‘lishi kerak?

$$14.29. \int_0^3 \frac{dx}{x+2}, \varepsilon = 10^{-1}.$$

$$14.30. \int_0^{\pi/2} e^x dx, \varepsilon = 10^{-3}.$$

$$14.31. \int_1^3 \sin x dx, \varepsilon = 10^{-3}.$$

$$14.32. \int_0^{0.5} \arcsin x dx, \varepsilon = 10^{-4}.$$

Quyidagi integralni, Simpson formulasi yordamida hisoblaganda, yo'l qo'yilgan xatoning berilgan  $\varepsilon$  dan oshmasligi uchun  $h$  qadam qanday bo'lishi kerak?

$$14.33. \int_0^{\frac{\pi}{2}} \cos \frac{x}{2} dx, \quad \varepsilon = 10^{-3}.$$

$$14.34. \int_1^3 \ln 2x dx, \quad \varepsilon = 10^{-4}.$$

$$14.35. \int_1^2 \frac{dx}{x^2}, \quad \varepsilon = 10^{-4}.$$

$$14.36. \int_0^2 \operatorname{arctg} x dx, \quad \varepsilon = 10^{-4}.$$

**14.37-14.41** misollardagi talablar ikki qismdan iborat bo'lib, ulardan biri trapesiya qoidasi, ikkinchisi esa, Simpson qoidasini qo'llab, integralni taqribiy hisoblash so'raladi.

I. Trapesiya qoidasi (usuli) dan foydalanish: a) integralni  $n=4$  qadam uchun yaqinlashtiring va

$$|R_p| \leq \frac{b-a}{12} h^2 M, \quad h = \frac{b-a}{n}, \quad \left( |R_p| \leq \frac{b-a}{12} |f''(\eta)| \cdot h^2 \right), \quad \eta \in [a, b]$$

munosabatdan foydalanib,  $|R_p|$  uchun yuqori chegarani toping; b) integralni bevosita hisoblang va  $|R_p|$  ni toping; c) taqribiy hisoblashdagi nisbiy xatoni (% larda) toping.

II. Simpson (parabola) qoidasi (usuli) dan foydalanish.

a) integralni  $n=4$  qadam uchun yaqinlashtiring va

$$|R_p| \leq \frac{b-a}{12} h^4 M, \quad h = \frac{b-a}{n}, \quad \left( |R_p| \leq \frac{b-a}{12} |h^4 \cdot f^{(4)}(\eta)| \right), \quad \eta \in [a, b]$$

munosabatdan foydalanib,  $|R_c|$  uchun yuqori chegarani toping; b) integralni bevosita hisoblang va  $|R_c|$  ni toping; c) taqribiy hisoblashdagi nisbiy xatoni (% larda) toping.

$$14.37. \int_1^2 x dx.$$

$$14.38. \int_{-1}^1 (x^2 + 1) dx.$$

$$14.39. \int_0^2 (x^3 + x) dx.$$

$$14.40. \int_1^2 \frac{1}{x^2} dx.$$

$$14.41. \int_0^{\pi} \sin x dx.$$

Quyidagi misollarda javoblarni to'rtta o'nliklar xonasigacha yaxlitlab yozing:

14.42. Ushbu  $\int_0^{12} x^2 dx$  integralning qiymati: a) chap chetki nuqta bo'yicha ( $n=12$  deb olib); b) o'ng chetki nuqta bo'yicha ( $n=12$  deb olib); c) o'rta nuqta bo'yicha ( $n=6$  deb olib); d) trapesiyalar qoidasi bo'yicha ( $n=12$  deb olib); e) Simpson qoidasi bo'yicha ( $n=6$  deb olib)

yaqinlashishlar bajarib, hisoblang. Natijalarni, integrallashni bajarib, tekshiring (solishtiring).

**14.43.** Ushbu  $\int_0^1 \sin^2 \pi x dx$  integralning qiymatini: *a)* chap chekti nuqta bo'yicha ( $n=3$  deb olib); *b)* o'ng chetki nuqta bo'yicha ( $n=3$  deb olib); *c)* trapesiyalar qoidasi bo'yicha ( $n=6$  deb olib); *d)* Simpson qoidasi bo'yicha ( $n=3$  deb olib) yaqinlashishlar bajarib, hisoblang. Natijalarni integrallashni bajarib, tekshiring (solishtiring).

**14.44.** Ushbu  $\int_0^1 \frac{dx}{1+x^2}$  integralning qiymatini: *a)* trapesiyalar qoidasi ( $n=4$  deb olib); *b)* Simpson qoidasi ( $n=4$  deb olib) bo'yicha yaqinlashishlar bajarib, hisoblang:

**14.45.** Ushbu  $\int_{-1}^1 \cos x^2 dx$  integralning qiymatini: *a)* o'rta nuqta bo'yicha ( $n=4$  deb olib); *b)* trapesiyalar qoidasi bo'yicha ( $n=8$  deb olib); *c)* Simpson qoidasi bo'yicha ( $n=4$  deb olib) yaqinlashishlar bajarib, hisoblang.

**14.46.** Ushbu  $\int_0^2 e^{-x^3} dx$  integralning qiymatini: *a)* trapesiyalar qoidasi ( $n=10$  deb olib); *b)* Simpson qoidasi ( $n=5$  deb olib) bo'yicha yaqinlashishlar bajarib, hisoblang.

Quyidagi misollarda, integralning qiymatini: *a)* trapesiyalar qoidasi bo'yicha; *b)* Simpson qoidasi bo'yicha yaqinlashtirishlar bajarib hisoblaganda  $n$  ning absolyut xato berilgan  $\varepsilon$  dan kichik bo'lishini kafolatlaydigan qiymatini toping:

$$14.47. \int_1^4 \sqrt{x} dx, \quad \varepsilon = 0,01.$$

$$14.48. \int_1^4 \sqrt{x} dx \quad \varepsilon = 0,00001.$$

$$14.49. \int_0^{\pi} \sin x dx; \quad \varepsilon = 0,001.$$

$$14.50. \int_1^3 e^x dx, \quad \varepsilon = 0,01.$$

$$14.51. 5) \int_0^2 e^{-x^2} dx, \quad \varepsilon = 0,0001.$$

## 15-§. Aniq integralning fizika masalalariga tadbiqlari

**15.1.Jismning bosib o'tgan yo'li.** Jism to'g'ri chiziqli harakat qilganda, uning  $t$  vaqt davomida o'zgarmas  $v$  tezlikda bosib o'tgan yo'li  $s$ , ushbu

$$s = vt \quad (15.1)$$

formula bo'yicha aniqlanadi.

Agar jism teklis harakat qilmasa, uning  $v$  tezligi  $t$  vaqtga bog'liq ravishda o'zgaradi, ya'ni

$$v = f(t).$$

Bu holda jismning  $t=t_1$  dan  $t=t_2$  gacha bo'lgan vaqt davomida bosib o'tgan yo'lini topish uchun,  $t_2-t_1$  vaqt oraliqini  $n$  ta teng va juda kichik  $\Delta t$  bo'laklarga bo'lamiz. Faraz qilaylik,  $\Delta t$  vaqt oraliqlarining har

birida jismning tezligi har bir qism vaqt oralig‘ining oxirida, sakrashga ega bo‘lgan holda, o‘zgarmas bo‘lib, qolsin,  $t_2 - t_1$  vaqt oralig‘i  $\Delta t = 1$  sek oraliqlarga bo‘lingan bo‘lsin.

Farazimizga ko‘ra, vaqt oralig‘ining birinchi sekundida jism tekis harakat qilib, uning oxirida o‘z tezligini o‘zgartiradi, ikkinchi sekundda esa, olingen tezlik bo‘yicha tekis harakat qiladi va ikkinchi sekundning oxirida yangi tezlikka ega bo‘ladi va uchinchi sekund davomida tekis harakat qiladi va h.k.

Shuning uchun, jismning  $\Delta t$  vaqtida bosib o‘tgan yo‘li (15.1) formula orqali topiladi va taqriban  $f(t)\Delta t$  ga teng bo‘ladi, qaralayotgan  $t_2 - t_1$  vaqt oralig‘ida bosib o‘tilgan yo‘l esa,

$$S \approx \sum_{t=t_1}^{t_2} f(t)\Delta t$$

ifodaga teng bo‘ladi.

Endi  $n$  bo‘linishlar sonini ko‘paytiramiz, u holda  $\Delta t$  hamda har bir  $\Delta t$  oraliqning oxirida tezlikning o‘zgarishidagi sakrashlar, borgan sari kichrayib boradi.

Agar  $n \rightarrow \infty$  bo‘lsa,  $\Delta t \rightarrow 0$ , demak,  $f(t)\Delta t \rightarrow 0$ . Bu shartda jismning tezligi, sakrashlarsiz, ya’ni uzluksiz o‘zgaradi va uning bosib o‘tgan yo‘li,

$$s = \lim_{\Delta t \rightarrow 0} \sum_{t=t_1}^{t_2} f(t)\Delta t$$

ifodaga teng bo‘ladi, bundan, aniq integralning ta’rifiga ko‘ra,

$$s = \lim_{\Delta t \rightarrow 0} \sum_{t=t_1}^{t_2} f(t)\Delta t = \int_{t_1}^{t_2} f(t)dt, s = \int_{t_1}^{t_2} f(t)dt. \quad (15.2)$$

### 15.1-misol. Jismning harakat tezligi

$$v = (2t^2 + t) \text{ cm/cek}$$

tenglama orqali berilgan. Jismning harakat boshlangandan so‘ng 6 sekund vaqt davomida o‘tgan yo‘lini aniqlang.

**Yechilishi.** (15.2) formulaga asosan,

$$s = \int_0^6 (2t^2 + t)dt = \left( \frac{2}{3}t^3 + \frac{1}{2}t^2 \right) \Big|_0^6 = \frac{2}{3} \cdot 6^3 + \frac{1}{2} \cdot 6^2 = 162 \text{ cm}.$$

**15.2. Kuch bajargan ish.** Faraz qilaylik, jism o‘zgarmas  $F$  kuch ta’siri ostida to‘g‘ri chiziq bo‘ylab harakat qilsin. U holda bosib o‘tilgan  $x$  yo‘lda bu  $F$  kuch tomonidan bajarilgan  $A$  ish,

$$A = Fx \quad (15.3)$$

formula bo‘yicha topiladi, bunda  $x$  – metrlarda,  $F$  – kilogrammlarda,  $A$  esa, kilogrammetrlarda ifodalanadi.

Agar jism o'zgaruvchan kuch ta'siri ostida harakat qilsa, uning bajargan ishi ancha qiyin aniqlanadi. Bu hol uchun formulani keltirib chiqaramiz.

Faraz qilaylik, O nuqtada tinch holatda turgan jism, o'tilgan yo'l x ga bog'liq ravishda o'zgaradigan  $F$  kuch ta'siri ostida harakat qilayotgan bo'lsin, ya'ni

$$F = f(x).$$

Shuningdek, vaqtning ba'zi momentlarida jism  $A$  va  $B$  nuqtalarda bo'lsin ( $15.1$ - chizma), bunda  $OA=a$  va  $OB=b$  bo'lsin.

---

O                    A                    B

---

### 15.1-chizma.

Endi yo'lning  $AB=b-a$  bo'lagida berilgan kuch bajargan ishni qanday aniqlash mumkinligini ko'rsatamiz. Buning uchun, yo'lning ko'rsatilgan  $AB$  bo'lagini  $n$  ta, o'zaro teng va juda kichik  $\Delta x$  kesmalarga bo'lamiz. Bu erda ham yuqoridagi yo'lni topish masalasidagi kabi, har  $\Delta x$  kesmada kuch, o'zgarmas qolib, uning oxirida, sakrashga ega bo'lib, o'zgaradi, deb faraz qilinadi. U holda, (15.1) formulaga asosan, yo'lning  $\Delta x$  bo'lagida kuchning bajargan ishi, taqriban

$$f(x)\Delta x$$

ifodaga teng bo'ladi, kuchning butun  $AB=b-a$  yo'l davomida bajargan ishi esa, taqriban,

$$A \approx \sum_{x=a}^b f(x)\Delta x$$

bo'ladi.

Endi bo'linishlar soni  $n$  ni cheksiz ortirrsak,  $\Delta x$  miqdor, va demak,  $f(x)\Delta x$  miqdor ham cheksiz kichik miqdorlar bo'ladi. Bunda kuch, sakrashlarga ega bo'lmasdan, uzluksiz o'zgaradi va izlanayotgan ish,

$$A = \lim_{\Delta x \rightarrow 0} \sum_{x=a}^b f(x)\Delta x$$

ifodaga, bundan aniq integralning ta'rifiga ko'ra,

$$A = \int_a^b f(x)dx \quad (15.4)$$

bo'ladi.

**15.2-misol.** 1 kG miqdordagi kuch prujinani 3 sm ga cho'zganda, u qanday ish bajarishini aniqlang.

**Yechilishi.** Guk qonuniga asosan, kuch prujinaning cho'zilishi yoki qisilishiga to'g'ri proporsional, ya'ni

$$F = kx,$$

bunda  $x$ -prujinaning cho'zilish yoki qisilish miqdori,  $k$ - proporsionallik koefitsiyenti. Qaralayotgan masalada  $k$  ning qiymatini topish uchun, berilganlarni, Guk qonunini ifodalovchi,  $F = kx$  tenglamaga keltirib qo'yamiz:  $1 = k \cdot 0,03$ , bu erdan  $k = \frac{1}{0,03}$  ekanligi kelib chiqadi.

Demak, prujinani cho'zuvchi kuch

$$F = \frac{1}{0,03}x$$

ko'rinishda ifodalanadi.

Kuch tinch holatda bo'lган prujinaga ta'sir qilgani uchun, (15.4) formuladagi integralning quyisi chegarasi  $a = 0$  bo'ladi, yuqori chegarasi esa,  $b = 0,03$  bo'ladi.

Demak, izlanayotgan ish:

$$A = \int_0^{0,03} \frac{1}{0,03} x dx = \frac{1}{0,03} \frac{x^2}{2} \Big|_0^{0,03} = \frac{1}{0,03} \cdot \frac{(0,03)^2}{2} = 0,015 \text{ кгм.}$$

**15.3-misol.** Massasi  $m$  bo'lган jismning Yer sirtidan vertikal  $h$  masofaga ko'tarishda bajariladigan ishni toping.

**Yechilishi.** Yerning tortish kuchini  $F$ , Yerning massasini  $m_e$  orqali belgilasak, u holda, Nyutonning qonuniga asosan,  $F = G \frac{m_e m}{x^2}$  bo'ladi, bunda,  $x$ - jismdan Yerning markazigacha bo'lган masofa. U holda  $m_e m \cdot G = K$  deb belgilasak,  $F = \frac{K}{x^2}$ ,  $R \leq x \leq h + R$ ,  $R$ -Yerning radiusi.  $x = R$  bo'lгanda,  $F(R)$ -kuch, jismning og'irligi  $P = mg$  ga teng bo'ladi, ya'ni

$$\frac{K}{R^2} = P, \quad K = P \cdot R^2, \quad F(x) = \frac{PR^2}{x^2}.$$

Shunday qilib, (13.30) formulasiga asosan, topamiz:

$$A = \int_R^{R+h} \frac{PR^2}{x^2} dx = PR^2 \int_R^{R+h} \frac{dx}{x^2} = -PR^2 \cdot \frac{1}{x} \Big|_R^{R+h} = \frac{PRh}{R+h}.$$

**15.4-misol.** Og'irligi  $P = 1,5 \text{ m}$  bo'lган raketani Yer sirtidan  $H = 2000 \text{ km}$  balandlikka ko'tarish uchun bajarilishi zarur bo'lган ishni toping.

**Yechilishi.** Yerning jismni tortish kuchi  $F$  yoki jismning og'irligi, uning Yerning markazidan qanday  $x$  uzoqlikda joylashganligiga bog'liq bo'ladi:

$$F(x) = \frac{\lambda}{x^2}, \quad \text{bu yerda, } \lambda - o'zgarmas son.$$

## 15-§. Aniq integralning fizika masalalariga tadbiqlari

**15.1.Jismning bosib o'tgan yo'li.** Jism to'g'ri chiziqli harakat qilganda, uning  $t$  vaqt davomida o'zgarmas  $v$  tezlikda bosib o'tgan yo'li  $s$ , ushbu

$$s = vt \quad (15.1)$$

formula bo'yicha aniqlanadi.

Agar jism tekis harakat qilmasa, uning  $v$  tezligi  $t$  vaqtga bog'liq ravishda o'zgaradi, ya'ni

$$v = f(t).$$

Bu holda jismning  $t=t_1$  dan  $t=t_2$  gacha bo'lgan vaqt davomida bosib o'tgan yo'lini topish uchun,  $t_2-t_1$  vaqt oralig'ini  $n$  ta teng va juda kichik  $\Delta t$  bo'laklarga bo'lamic. Faraz qilaylik,  $\Delta t$  vaqt oraliqlarining har

porshenning to‘la  $S$  yuzasiga bo‘lgan bosim esa,  $P(x) = Sp(x) = \frac{c}{H-x}$   
bo‘ladi.

Endi, porshenni  $x$  ga itarishda sarflanadigan ishni qandaydir  $q(x)$  funksiya deb olib, va porshenni kichik  $dx$  masofaga itarishda unga ta’sir qiladigan  $P(x)$  bosimni o‘zgarmas, deb hisoblab,  $q(x)$  funksiya ortirmasi differensialining taqrifiy miqdorini topamiz:

$$\Delta q \approx P(x)dx = \frac{c}{H-x}dx = dq$$

Izlanayotgan umumiy  $A$  ishga  $x$  ning  $o$  dan  $h$  gacha o‘zgarishi mos keladi, shuning uchun,

$$A = c \int_{o}^{h} \frac{dx}{H-x} = -c \ln(H-x) \Big|_o^h = c \ln \frac{H}{H-h}.$$

$H = 1,5m$ ,  $R = 0,4m$ ,  $h = 1,2m$ ,  $p_0 = 10330k\Gamma/m^2$  bo‘lganda,

$$v_0 = \pi R^2 H = 0,24 \pi m^3; c = p_0 v_0 = 2479,2\pi; Q \approx 12533,3k\Gamma m \approx 122951,7 j.$$

### 15.3. Iqtisodiy hisob-kitoblarga tadbiqlar bo‘yicha misollar.

**15.6-misol.** Agar korxonadagi ishchining mehnat mahsuldorligi

$$f(t) = \frac{3}{3t+1} + 4$$

funksiya orqali ifodalansa, ishchi ish kunining uchinchi soati davomida qancha hajmdagi mahsulot ishlab chiqarishini aniqlang.

**Yechilishi.** Agar ishchining  $t$  vaqt davomidagi mehnat mahsuldorligi uzluksiz  $f(t)$  funksiya orqali ifodalansa, ishchi  $t_1$  dan  $t_2$  gacha o‘tgan vaqt oralig‘ida, hajmi

$$V = \int_{t_1}^{t_2} f(t)dt \quad (15.5)$$

formula bo‘yicha aniqlanadigan, mahsulot ishlab chiqaradi. Qaralayotgan misolda,

$$f(t) = \frac{3}{3t+1} + 4; t_1 = 2, t_2 = 3$$

bo‘lganligidan, izlanayotgan hajm,

$$\begin{aligned} V &= \int_2^3 \left( \frac{3}{3t+1} + 4 \right) dt = \left( \ln(3t+1) + 4t \right) \Big|_2^3 = \\ &= \ln 10 + 12 - \ln 7 - 8 = \ln \frac{10}{7} + 4 \end{aligned}$$

bo‘ladi.

**15.7-misol.** Agar magazinga yangi tovar olib kelinishi  $f(t) = 2t + 5$  funksiya orqali ifodalansa, magazinda uch kun mobaynida qancha hajmda tovar to‘planishini aniqlang.

**Yechilishi.** Qaralayotgan misolda

$$f(t) = 2t + 5, \quad t_1 = 0, \quad t_2 = 3$$

bo‘lganligidan, izlanayotgan hajm uchun, (15.5) formuladan foydalan-gan holda,

$$V = \int_0^3 (2t + 5) dt = \left( \frac{2t^2}{2} + 5t \right) \Big|_0^3 = 9 + 15 = 24$$

bo‘lishini olamiz.

**15.4. Elektr energiyasining sarflanishini bashorat qilish (oldindan aytish).** Ma’lumki, elektr energiyasining har bir chiroq yoki fonar tomonidan sarflanishi, quyosh botgandan to u chiqquncha davom etadi. Kecha qancha qisqa bo‘lsa, shuncha kam elektr energiyasi sarflanadi. Yilda eng qisqa tun 22 iyunga to‘g‘ri kelganligini, eng uzun tun esa, 22 dekabrga to‘g‘ri kelganligini hisobga olsak, ulardan birinchisida, ikkinchisidan kam energiya sarflanishini olamiz.

Shunday qilib, energiyaning sarflanishi  $\omega$ - tebranishli jarayondan iborat ekan. Bu jarayon,

$$w = b + c \cos(2\pi(\omega t + 0,025)) \quad (15.6)$$

funksiya orqali ifodalanishi mumkin. Bunda 0,025 qo’shiluvchi, maksimumning,  $\omega = -0,025$  qiymatga to‘g‘ri kelishini, ya’ni har bir yil boshlanishidan  $0,025 \cdot 365 = 9$  kun oldinga, 22 dekabrga to‘g‘ri kelishini ko‘rsatadi;  $2\pi$  ko‘paytuvchi esa, uzunligi 1 ga (yilga) teng bo‘lgan davrni aniqlaydi.

**15.8-misol.** Tarmoq tomonidan,  $x=0$  dan  $x=1$  gacha, bir yilda energiya sarflanishi, (15.6) funksiya orqali ifodalsin, bu erda  $b$  va  $c$  qandaydir sonlar. U holda, tarmoq  $t=0$  dan  $t=1$  gacha o’tgan bir yilda qancha energiya sarflashini aniqlang.

**Yechilishi.** Yuqoridaqgi bandlarda bajarilgan ishlarni hisobga olgan holda,  $dt$  vaqt davomida sarflangan energiya  $w dt$ , yil davomida sarflangan energiya esa,

$$\int_0^1 w dt$$

integralga teng bo‘lishini ko‘ramiz. U holda,

**Yechilishi.** Guk qonuniga asosan, kuch prujinaning cho'zilishi yoki qisilishiga to'g'ri proporsional, ya'ni

$$F = kx,$$

bunda  $x$ -prujinaning cho'zilish yoki qisilish miqdori,  $k$ - proporsionallik koeffitsiyenti. Qaralayotgan masalada  $k$  ning qiymatini topish uchun, berilganlarni, Guk qonunini ifodalovchi,  $F = kx$  tenglamaga keltirib qo'yamiz:  $1 = k \cdot 0,03$ , bu erdan  $k = \frac{1}{0,03}$  ekanligi kelib chiqadi.

Demak, prujinani cho'zuvchi kuch

$$F = \frac{1}{0,03}x$$

ko'rinishda ifodalanadi.

Kuch tinch holatda bo'lган prujinaga ta'sir qilgani uchun, (15.4) formuladagi integralning quyi chegarasi  $a = 0$  bo'ladi, yuqori chegarasi esa,  $b = 0,03$  bo'ladi.

Demak, izlanayotgan ish:

$$A = \int_0^{0,03} \frac{1}{0,03} x dx = \frac{1}{0,03} \frac{x^2}{2} \Big|_0^{0,03} = \frac{1}{0,03} \cdot \frac{(0,03)^2}{2} = 0,015 \text{ km}.$$

**15.3-misol.** Massasi  $m$  bo'lган jismning Yer sirtidan vertikal  $h$  masofaga ko'tarishda bajariladigan ishni toping.

**Yechilishi.** Yerning tortish kuchini  $F$ , Yerning massasini  $m_e$  orqali belgilasak, u holda, Nyutonning qonuniga asosan,  $F = G \frac{m_e m}{x^2}$  bo'ladi, bunda,  $x$ - jismdan Yerning markazigacha bo'lган masofa. U holda  $m_e m \cdot G = K$  deb belgilasak,  $F = \frac{K}{x^2}$ ,  $R \leq x \leq h+R$ ,  $R$ -Yerning radiusi.  $x = R$  bo'lганда,  $F(R)$ -kuch, jismning og'irligi  $P = mg$  ga teng bo'ladi, ya'ni

$$\frac{K}{R^2} = P, \quad K = P \cdot R^2, \quad F(x) = \frac{PR^2}{x^2}.$$

Shunday qilib, (13.30) formulasiga asosan, topamiz:

$$A = \int_R^{R+h} \frac{PR^2}{x^2} dx = PR^2 \int_R^{R+h} \frac{dx}{x^2} = -PR^2 \cdot \frac{1}{x} \Big|_R^{R+h} = \frac{PRh}{R+h}.$$

**15.4-misol.** Og'irligi  $P = 1,5 \text{ m}$  bo'lган raketani Yer sirtidan  $H = 2000 \text{ km}$  balandlikka ko'tarish uchun bajarilishi zarur bo'lган ishni toping.

**Yechilishi.** Yerning jismni tortish kuchi  $F$  yoki jismning og'irligi, uning Yerning markazidan qanday  $x$  uzoqlikda joylashganligiga bog'liq bo'ladi:

$$F(x) = \frac{\lambda}{x^2}, \quad \text{bu yerda, } \lambda - o'zgarmas son.$$

## Mustaqil yechish uchun misollar

**15.1.** Bo'shlqdä pastga tushayotgan jismning tezligi  $v=9,8t \text{ m/cek}$  formula bo'yicha aniqlanadi. Jism tushish boshlangandan 10 sekund vaqt o'tganda qancha yo'l bosib o'tishini aniqlang.

**15.2.** Jismning harakat tezligi  $v=(3t^2 - 2t) \text{ cm/cek}$  formula bo'yicha aniqlanadi. Jism harakat boshlangandan 4 sekund vaqt o'tganda qancha yo'l bosib o'tadi?

**15.3.** Jismning harakat tezligi  $v=\sqrt{5t+4} \text{ m/cek}$  formula bo'yicha aniqlanadi. Jism harakat boshlangandan 9 sekund vaqt o'tganda qancha yo'l bosib o'tadi?

**15.4.** Jismning harakat tezligi  $v=(4t - \frac{6}{t^2}) \text{ cm/cek}$ . Uning uchinchi sekundda bosib o'tgan yo'lini aniqlang.

**15.5.** 6 kG miqdordagi kuch prujinani 8 sm ga cho'zganda, u qanday ish bajarishini aniqlang.

**15.6.** Prujinani 4 sm ga cho'zganda 10 kGm miqdordagi ish bajarilishi ma'lum. Prujinani 10 sm ga cho'zish uchun qanday ish bajarilishini toping.

**15.7.** Radiusi  $R$  ga teng bo'lgan yarim shar shaklidagi qog'ozdan suvni chiqarishda sarf bo'ladigan ish miqdorini aniqlang.

**15.8.** Silindrda diametri 20 sm va uzunligi 80 sm bo'lgan porshen harakat qiladi. Bu silindr  $P_0 = 10 \text{ kN/cm}^2$  bosim ostida bug' bilan to'ldirilgan bo'lsa, temperaturani o'zgartirmasdan qanday ish bajarilganda, bug'ning hajmi ikki baravar kamayadi?

**15.9.** Agar 5 kG kuch prujinani 25 sm ga cho'zsa, u holda prujinani 6 sm ga cho'zish uchun qanday ish bajarish kerak?

**15.10.** Agar 1 kG kuch elastik prujinani 1 sm ga cho'zsa, u holda, prujinani 10 sm ga cho'zish uchun qanday ish bajarish kerak (Guk qoidasidan foydalanish kerak)?

**15.11.** Agar korxonadagi ishchining mehnat mahsuldorligi  $f(t) = \frac{4}{4t+1} + 1$  funksiya orqali ifodalansa, ishchi ish kunining to'rtinchisi soati davomida qancha hajmdagi mahsulot ishlab chiqarishini aniqlang.

**15.12.** Agar magazinga yangi tovarlar olib kelinishi  $f(t) = 2t + 5$  funksiya orqali ifodalansa, magazinda 6 kun mobaynida qancha hajmda tovar to'planishini aniqlang.

**15.13.** Tarmoq tomonidan  $x=0$  dan  $x=1$  gacha o'tgan, bir yilda energiya sarflanishi  $w = 3 + 2\cos(2\pi(t+0,025))$  funksiya orqali ifodalansin. 2

yilda, ya'ni  $t=0$  dan  $t=2$  gacha o'tgan davrda sarflangan energiya miqdorini aniqlang.

**15.14.** Har bir lampa va fonarning  $x=0$  dan  $x=1$  gacha o'tgan vaqtda energiya sarflashi  $w = 3 + 2 \cos(2\pi(t+0,025))$  funksiya orqali ifodalangan bo'lsin. bunda  $b$  va  $c$ - qandaydir sonlar. Tumanning yoritish tarmog'i  $u = 2 + 5t$  chiziqli qonun bo'yicha o'ssin (ortsin), bu erda  $t$ - yillar bilan o'lchanadi. U holda tarmoqning  $t=0$  dan  $t=1$  gacha o'tgan 1 yilda sarflagan energiyasini hisoblang.

**15.15.** Har bir lampa va fonarning  $x=0$  dan  $x=1$  gacha energiya sarflashi  $w = 3 + 2 \cos(2\pi(t+0,025))$  funksiya orqali ifodalangan bo'lsin, bunda  $b$  va  $c$ - qandaydir sonlar to'plamining yorilishi tarmog'i  $u = 1 + 2t^2$  kvadratik qonun bo'yicha o'ssin (ortsin), bu erda  $t$ - yillar bilan o'lchanadi. U holda, tarmoqning  $t=0$  dan  $t=1$  gacha o'tgan 1 yilda sarflagan energiyasini hisoblang.

## IV bob. KO'P O'ZGARUVCHILI FUNKSIYALAR

### 16-§. Evklid tekisligi va Evklid fazosi. Evklid fazosidagi muhim to'plamlar

**16.1. Evklid tekisligi va Evklid fazosi.**  $x$  va  $y$  haqiqiy sonlarning mumkin bo'lgan har qanday tartiblangan  $(x, y)$  juftlari - to'plamiga *koordinatalar tekisligi* deyiladi. Bunda har bir  $(x, y)$ - juftlik koordinatlar tekisligining *nuqtasi* deyiladi va qisqacha,  $M$  harfi orqali belgilanadi.  $x$  va  $y$  sonlar-  $M$  nuqtaning *koordinatalari* deyiladi.  $M(x, y)$  yozuvda,  $x$  va  $y$  -  $M$  nuqtaning koordinatalarini anglatadi.

**16.1-ta'rif.** Agar koordinatalar tekisligining ixtiyoriy  $M_1(x_1, y_1)$  va  $M_2(x_2, y_2)$  nuqtalari orasidagi  $\rho(M_1, M_2)$  masofa tushunchasi kiritilgan bo'lib, u

$$\rho(M_1, M_2) = \sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2}$$

formula bo'yicha aniqlansa, u holda koordinatalar tekisligi *Evklid tekisligi* deyiladi va  $R^2$  orqali belgilanadi.

m o'ichovli koordinatalar fazosi va Evklid fazosi tushunchalari ham shunga o'xshash kiritiladi.  $x_1, x_2, \dots, x_m$  haqiqiy sonlarning mumkin bo'lgan har qanday tartiblangan  $x_1, x_2, \dots, x_m$  qiymatlar to'plamiga *koordinatlar fazosi* deyiladi. Bunda har bir koordinatalar fazosining  $(x_1, x_2, \dots, x_m)$  nuqtasi  $M$  yoki  $M(x_1, x_2, \dots, x_m)$  orqali belgilanadi,  $x_1, x_2, \dots, x_m$  sonlar esa,  $M$  nuqtaning *koordinatalari* deyiladi.

Agar koordinatalar fazosining  $M'(x_1, x_2, \dots, x_m)$  va  $M''(x_1^*, x_2^*, \dots, x_m^*)$  nuqtalari orasidagi  $\rho(M', M'')$  masofa tushunchasi kiritilgan bo'lib, u

$$\rho(M', M'') = \sqrt{(x_1^* - x_1)^2 + (x_2^* - x_2)^2 + \dots + (x_m^* - x_m)^2}$$

formula bo'yicha aniqlansa, u holda koordinatalar fazosi, *Evklid fazosi* deyiladi va  $R'''$  kabi belgilanadi.

$R'''$  fazoda  $x$  va  $y$  nuqtalar orasidagi  $\rho(x, y)$  masofa quyidagi xossalarga ega:

16.  $\rho(x, y) \geq 0$ ,  $\rho(x, y) = 0$  faqat va faqat  $x = y$  bo'lganda;

2<sup>0</sup>.  $\rho(x, y) = \rho(y, x)$ ;

3<sup>0</sup>.  $\rho(x, y) \leq \rho(x, z) + \rho(z, y)$ .

**16.2. Evklid fazosidagi muhim to‘plamlar.** Evklid fazosidagi  $\{M\}$  to‘plamga doir misollar keltiramiz.

1)  $\{M\} = \{(x, y) : x \in R, y \in R, (x-a)^2 + (y-b)^2 \leq r^2\}$  to‘plamga,  $R^2$  fazoda, markazi  $M_0(a; b)$  nuqtada, radiusi  $r$  ga teng bo‘lgan yopiq doira ( $(x-a)^2 + (y-b)^2 < r^2$  ga - ochiq doira) deyiladi. Mos ravishda,  $(x_1, x_2)$ ,  $(x_1, x_2, x_3)$  va  $(x_1, x_2, \dots, x_m)$  tartiblangan juftlik, uchlik va hokazolarni ikki o‘lchovli, uch o‘lchovli va  $m$  o‘lchovli vektorlarning koordinatalari deb ham qarash mumkin:

$$x = (x_1, x_2), x = (x_1, x_2, x_3), x = (x_1, x_2, \dots, x_m).$$

Ko‘p hollarda,  $x = (x_1, x_2, \dots, x_m)$  simvolga, koodinatalari  $x_1, x_2, \dots, x_m$  bo‘lgan  $M$  nuqta yoki  $\overrightarrow{OM}$  vektor, deb qaraladi.

**16.1-eslatma.** Agar  $R^m$  koordinatalar fazosini koordinatalari  $x_1, x_2, \dots, x_m$  bo‘lgan  $x$  vektorlar fazosi deb qaralsa, u holda,  $x = (x_1, x_2, \dots, x_m)$ ,  $y = (y_1, y_2, \dots, y_m)$  vektorlarning yig‘indisi deb, koordinatalari  $x_1 + y_1, x_2 + y_2, \dots, x_m + y_m$  bo‘lgan vektorga aytildi;  $x = (x_1, x_2, \dots, x_m)$  vektorming biror  $\lambda$ - haqiqiy songa  $\lambda x$  ko‘paytmasi deb, koordinatalari  $\lambda x_1, \lambda x_2, \dots, \lambda x_m$  bo‘lgan vektorga aytildi.

Agar  $R^m$ - vektorlar fazosi deb qaralib, uning elementlarini qo‘sish va biror haqiqiy songa ko‘paytirish amallari aniqlangan bo‘lib, bu amallar, quyidagi: 1)  $x + y = y + x$ ; 2)  $(x + y) + z = x + (y + z)$ ; 3) shunday 0 nul element mavjud bo‘lib,  $\forall x$  element uchun  $x + 0 = x$ ; 4)  $\forall x$  uchun unga qarama – qarshi  $x$  vektor mavjud bo‘lib,  $x + x' = 0$ ; 5)  $\lambda(x + y) = \lambda x + \lambda y$ ; 6)  $(\lambda + \mu)x = \lambda x + \mu x$ ; 7)  $\lambda(\mu x) = (\lambda\mu)x$ ; 8)  $1 \cdot x = x$  aksiomalarni qanoatlantirsa, u holda,  $R^m$ - chiziqli vektor fazo deyiladi.

$R^m$  chiziqli vektor fazoda ikkita  $x = (x_1, x_2, \dots, x_m)$ ,  $y = (y_1, y_2, \dots, y_m)$  vektorga  $(x, y) = \sum_{i=1}^m x_i y_i$  sonni mos qo‘yish orqali, ikki vektorming  $(x, y)$  skalyar ko‘paytmasi aniqlanadi.  $\sqrt{(x, x)}$  son  $x$  vektorming uzunligi deyiladi va  $y \neq 0$  kabi belgilanadi.

Agarda  $(x, y) = 0$  bo‘lsa, u holda,  $x$  va  $y$  vektorlar o‘zaro ortogonal deyiladi.

Agar  $x$  va  $y$  vektorlar nuldan farqli vektorlar bo‘lsa, u holda, ular orasidagi  $\phi$  ( $0 \leq \phi \leq \pi$ ) burchak

$$\cos \phi = \frac{(x, y)}{|x||y|}$$

formula orqali topiladi.

2)  $\{M\} = \{(x, y, z) : x \in R, y \in R, z \in R, (x-a)^2 + (y-b)^2 + (z-c)^2 \leq r^2\}$  to‘plam  $R^3$  fazoda markazi  $M_0(a, b, c)$  nuqtada, radiusi  $r$  ga teng bo‘lgan yopiq shar ( $(x-a)^2 + (y-b)^2 + (z-c)^2 < r^2 - ochiq shar$ ) deyiladi va u qisqacha,  $\rho(M, M_0) < r$ , ( $\rho(M, M_0) < y$ ) kabi yoziladi.

3)  $\{M\} = \{(x, y) : x \in R, y \in R, |x-a| \leq d_1, |y-b| \leq d_2\}$  to‘plam markazi  $M_0(a; b)$  nuqtada bo‘lgan koordinatalar to‘g‘ri to‘rburchagi,

$$\{M\} = \{(x, y, z) : x \in R, y \in R, z \in R, |x-a| \leq d_1, |y-b| \leq d_2, |z-c| \leq d_3\}$$

to‘plam esa, markazi  $M_0(a, b, c)$  nuqtada bo‘lgan koordinatalar parallelepipedi deyiladi.

4)  $\{M\} = \{(x_1, x_2, \dots, x_m) : x_i \in R, i = \overline{1, m}, (x_1 - x_1^0)^2 + (x_2 - x_2^0)^2 + \dots + (x_m - x_m^0)^2 \leq r^2\}$  to‘plam,  $R^m$  fazoda, markazi  $M_0(x_1^0, x_2^0, \dots, x_m^0)$  nuqtada, radiusi  $r$  ga teng bo‘lgan yopiq shar deyiladi va qisqacha,  $\rho(M, M_0) \leq r$  shaklida yoziladi ( $\rho(M, M_0) < r - ochiq shar$ ).

5)  $\{M\} = \{(x_1, x_2, \dots, x_m) : x_i \in R, i = \overline{1, m}, (x_1 - x_1^0)^2 + (x_2 - x_2^0)^2 + \dots + (x_m - x_m^0)^2 = r^2\}$  to‘plam,  $R^m$  fazoda, markazi  $M_0(x_1^0, x_2^0, \dots, x_m^0)$  nuqtada, radiusi  $r$  teng bo‘lgan sfera deyiladi.

**16.2-eslatma.** Markazi  $M_0(x_1^0, x_2^0, \dots, x_m^0)$  nuqtada, radiusi  $r$  ga teng bo‘lgan ochiq sharga, markazi  $M_0(x_1^0, x_2^0, \dots, x_m^0)$  nuqtada radiusi  $r$  ga teng bo‘lgan sferani qo‘shsak, natijada markazi  $M_0$  nuqtada radiusi  $r$  ga teng bo‘lgan yopiq shar hosil bo‘ladi.

**16.2-ta‘rif.** Markazi  $M_0(x_1^0, x_2^0, \dots, x_m^0)$  nuqtada radiusi  $\varepsilon > 0$  bo‘lgan ochiq  $\rho(M, M_0) < \varepsilon$  sharga  $M_0$  nuqtaning atrofi deyiladi.

$\{M\} = \{(x_1, x_2, \dots, x_m) : x_i \in R, i = \overline{1, m}, |x_1 - x_1^0|^2 < d_1, |x_2 - x_2^0|^2 < d_2, \dots, |x_m - x_m^0|^2 < d_m\}$  to‘plam ( $d_1, d_2, \dots, d_m$  – lar biror o‘zgarmas sonlar),  $m$  – o‘lchovli ochiq koordinatalar parallelepipedi yoki  $M_0$  nuqtaning to‘g‘ri burchakli atrofi deyiladi.

Quyidagi elementar tasdiqlar o‘rinli:  $M_0$  nuqtaning ixtiyoriy  $\varepsilon$  - atrofi,  $M_0$  nuqtaning biror to‘g‘ri burchakli atrofida joylashadi;  $M_0$  nuqtaning ixtiyoriy to‘g‘ri bo‘rchakli atrofi, uning biror  $\varepsilon$  - atrofida joylashadi.

Haqiqatan ham, belgilangan  $\varepsilon > 0$  da  $d_1 = d_2 = \dots = d_m = \frac{\varepsilon}{\sqrt{m}}$  deb olinsa, u holda ko‘rsatilgan  $d_1, d_2, \dots, d_m$  – larda  $M_0$  nuqtaning to‘g‘ri burchakli atrofi uning  $\varepsilon$  - atrofida joylashadi.

Agar  $d_1 > 0, d_2 > 0, \dots, d_m > 0$  lar belgilanib,  $\varepsilon = \min\{d_1, d_2, \dots, d_m\}$  deb olinsa, u holda,  $M_0$  nuqtaning (ko'rsatilgan  $d_1, d_2, \dots, d_m$  - larda) to'g'ri burchakli atrofida, uning  $\varepsilon$  - atrofi yotadi.

**16.3-ta'rif.** Agar  $M \in \{M\} \subset R^m$  nuqtaning shunday  $\varepsilon$  - atrofi mavjud bo'lib, bu atrofnинг barcha nuqtalari  $\{M\}$  to'plamga qarashli bo'lsa, u holda,  $M$  nuqta,  $\{M\}$  to'plamning *ichki nuqtasi* deyiladi.

Agar  $M \in R^m$  nuqtaning shunday  $\varepsilon$  - atrofi mavjud bo'lib, bu atrofnинг barcha nuqtalari  $\{M\}$  to'plamga qarashli bo'lmasa,  $M$  nuqta,  $\{M\}$  to'plamning *tashqi nuqtasi* deyiladi.

**16.4-ta'rif.** Agar  $M \in \{M\} \subset R^m$  nuqta,  $\{M\}$  to'plamning ichki nuqtasi ham, tashqi nuqtasi ham bo'lmasa, u holda,  $M$  nuqta,  $\{M\}$  to'plamning *chevara nuqtasi* deyiladi.

**16.5-ta'rif.** Agar  $\{M\} \subset R^m$  to'plamning hamma elementlari uning ichki nuqtalari, ya'ni uning ixtiyoriy  $M$  nuqtasi, o'zining ixtiyoriy  $\varepsilon$  - atrofi bilan  $\{M\}$  ga qarashli, bo'lsa, u holda,  $\{M\}$  to'plam, *ochiq to'plam* deyiladi.

**16.6-ta'rif.**  $M_0$  nuqtani o'zida saqlovchi ixtiyoriy ochiq to'plamga  $M_0$  nuqtaning *atrofi* deyiladi.

**16.7-ta'rif.** Agar ixtiyoriy  $\{M\} \subset R^m$  to'plam o'zining hamma chevara nuqtalarini o'zida saqlasa, u holda,  $\{M\}$  to'plam, *yopiq to'plam* deyiladi.

**16.8-ta'rif.** Agar  $A \in R^m$  nuqtaning ixtiyoriy  $\varepsilon$  - atrofida  $\{M\} \subset R^m$  to'plamning, hech bo'limganda,  $A$  dan farqli bitta nuqtasi mavjud bo'lsa, u holda,  $A$  nuqta,  $\{M\}$  to'plamning *limit nuqtasi* deyiladi.

$\{M\}$  to'plam yopiq bo'lishi uchun, uning hamma limit nuqtalari unga qarashli bo'lishi zarur va etarlidir.

**16.9-ta'rif.** Agar shunday  $m$ -o'lchovli shar mavjud bo'lib,  $\{M\}$  to'plamning barcha elementlari shu sharga qarashli bo'lsa, u holda,  $\{M\}$  to'plam, *chegaralangan* deyiladi.

**16.10-ta'rif.** Ushbu

$$L = \left\{ M(x_1, x_2, \dots, x_m) \in R^m : x_1 = \varphi_1(t), x_2 = \varphi_2(t), \dots, x_m = \varphi_m(t), \alpha \leq t \leq \beta \right\},$$

to'plam, bunda  $\varphi_1(t), \varphi_2(t), \dots, \varphi_m(t)$  funksiyalar  $[\alpha, \beta]$  segmentda uzluksiz funksiyalar, *uzluksiz chiziq* deyiladi.  $A(\varphi_1(\alpha), \dots, \varphi_m(\alpha))$  va  $B(\varphi_1(\beta), \dots, \varphi_m(\beta))$  nuqtalar  $L$  chiziqning *uchlari* deyiladi.

Ushbu

$$\{M(x_1, x_2, \dots, x_m) \in R^m : x_1 = x_1^0 + \alpha_1 t, x_2 = x_2^0 + \alpha_2 t, \dots, x_m = x_m^0 + \alpha_m t; -\infty < t < \infty\}$$

(bunda,  $x_1^0, \dots, x_m^0; \alpha_1, \alpha_2, \dots, \alpha_m$  – qandaydir sonlar) to‘plam,  $R^m$  fazoda to‘g‘ri chiziq deyiladi. Ma’lumki, bu to‘g‘ri chiziq  $M_0(x_1^0, x_2^0, \dots, x_m^0)$  nuqtadan o‘tadi ( $M_0$  nuqta  $t = 0$  ga mos keladi).

**16.11-ta’rif.** Agar  $\{M\}$  to‘plamning ixtiyoriy ikkita nuqtasini, shu to‘plamda to‘liq yotuvchi uzluksiz chiziq bilan tutashtirish mumkin bo‘lsa, u holda,  $\{M\}$  to‘plamga bog‘lamli to‘plam deyiladi.

**16.12-ta’rif.** Agar  $E \subset R^m$  to‘plam ochiq bog‘lamli to‘plam bo‘lsa, u holda,  $E$  to‘plam,  $R^m$  fazoda soha deyiladi.

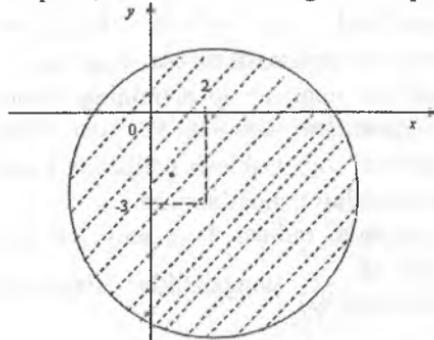

Soha va uning chegarasining birlashmasi – *yopiq soha* deyiladi.

**16.1-misol.** Tekislikda koordinatalari, ushbu

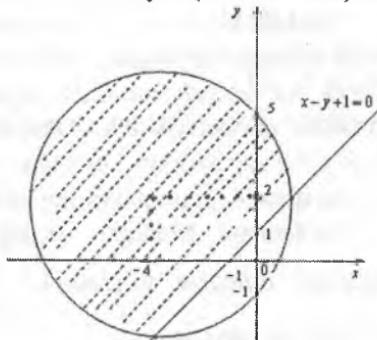

$$(x-2)^2 + (y+3)^2 < 25 \quad (16.1)$$

tengsizlikni qanoatlantiradigan nuqtalar to‘plamining geometrik o‘rnini aniqlang.

**Yechilishi.** Ma’lumki,  $\{M\} = \{(x, y) : x \in R, y \in R : (x-a)^2 + (y-b)^2 < r^2\}$  to‘plam,  $R^2$  fazoda, markazi  $M(a, b)$  nuqtada, radiusi  $r$  ga teng bo‘lgan ochiq doirani ifodalaydi. Shuning uchun, koordinatalari (16.1) tengsizlikni qanoatlantiruvchi nuqtalar to‘plami – markazi  $M_0(2; -3)$  nuqtada, radiusi  $r = 5$  bo‘lgan ochiq doirani ifodalaydi (16.1-chizma).

16.1-chizma.

16.2-chizma.

**16.2-misol.** Tekislikda koordinatalari

$$\begin{cases} (x+4)^2 + (y-2)^2 \leq 25, \\ x - y + 1 \leq 0 \end{cases} \quad (16.2)$$

tengsizliklar sistemasini qanoatlantiruvchi nuqtalar to‘plamining geometrik o‘rnini aniqlang.

**Yechilishi.** Markazi  $M_0(-4;2)$  nuqtada, radiusi 5 ga teng bo'lgan yopiq doirada yotgan barcha nuqtalarning koordinatalari  $(x+4)^2 + (y-2)^2 \leq 25$  tengsizlikni qanoatlantiradi.

$x-y+1 \leq 0$  tengsizlikni  $y \geq x+1$  ko'rinishda yozib olamiz.  $y=x+1$  to'g'ri chiziqda va undan yuqorida joylashgan nuqtalarning koordinatalari  $x-y+1 \leq 0$  tengsizlikni qanoatlantiradi (16.2-chizma).

$(x+4)^2 + (y-2)^2 = 25$  aylana bilan  $y=x+1$  to'g'ri chiziqning kesishish nuqtasini topish uchun  $\begin{cases} (x+4)^2 + (y-2)^2 = 25 \\ x-y+1 = 0 \end{cases}$  sistemani birgalikda Yechib,

$A(1;2)$ ,  $B(-4;-3)$  ekanligini topamiz. (16.2) tengsizliklar sistemasini qanoatlantiruvchi nuqtalar to'plami,  $(x+4)^2 + (y-2)^2 = 25$  aylana va uning ichida joylashgan, hamda  $y=x+1$  to'g'ri chiziq va undan yuqorida joylashgan nuqtalarning kesishmasidir.

**16.3-misol.** Fazoda koordinatalari,

$$\begin{cases} x^2 + y^2 + z^2 \geq 36, \\ 2x - 3y + z - 2 \geq 0 \end{cases}$$

tengsizliklar sistemasini qanoatlantiruvchi nuqtalar to'plamining geometrik o'rmini aniqlang.

**Yechilishi.**  $x^2 + y^2 + z^2 \geq 36$  tengsizlikni,  $x^2 + y^2 + z^2 = 36$  sferada va undan tashqarida yotgan,  $2x - 3y + z - 2 \geq 0$  tengsizlikni esa,  $z = 2 - 2x + 3y$  tekislik va undan yuqorida joylashgan nuqtalar to'plamining koordinatalari qanoatlantiradi. Demak, sistemani,  $z \geq 2 - 2x + 3y$  fazo bilan  $x^2 + y^2 + z^2 \geq 36$  sharning kesishgan qismini olib tashlash natijasida hosil bo'lgan qismidagi nuqtalarning koordinatalari qanoatlantiradi.

**16.4-misol.** Markazi  $M_0(1;2)$  nuqtada, radiusi 4 ga teng bo'lgan doiradagi nuqtalar to'plamini,  $\begin{cases} a \leq x \leq b, \\ \varphi(x) \leq y \leq \psi(x) \end{cases}$  tengsizliklar sistemasi ko'rinishida tasvirlang.

**Yechilishi.** Ravshanki, berilgan doiradagi nuqtalarning absissasi – 3 dan 5 gacha o'zgaradi.  $(x-1)^2 + (y-2)^2 = 16$  aylana tenglamasini,  $y = 2 \pm \sqrt{15-x^2+2x}$  ko'rinishda yozamiz.

Bunda,  $y = 2 + \sqrt{15-x^2+2x}$  aylananing yuqori qismini,  $y = 2 - \sqrt{15+2x-x^2}$  esa, aylanining pastki qismini ifodalaydi. Demak,  $x \in [-3;5]$  segmentda o'zgarganda,  $y$  ning qiymatlari  $2 - \sqrt{15+2x-x^2}$  dan  $2 + \sqrt{15+2x-x^2}$  gacha o'zgaradi. Shunday qilib, berilgan doiraning nuqtalari to'plami,

$$\begin{cases} -3 \leq x \leq 5, \\ 2 - \sqrt{12 + 2x - x^2} \leq y \leq 2 + \sqrt{15 + 2x - x^2} \end{cases}$$

tengsizliklar sistemasi yordamida berilgan ekan.

**16.5-misol.** Ushbu  $\frac{x^2}{25} + \frac{y^2}{16} + z^2 = 1$  ellipsoid bilan chegaralangan to‘plamni, quyidagi,  $\begin{cases} a \leq x \leq b, \\ \varphi(x) \leq y \leq \psi(x), \\ \Phi(x, y) \leq z \leq \Psi(x, y) \end{cases}$  tengsizliklar sistemasi ko‘rinishida tasvirlang.

**Yechilishi.** Berilgan ellipsoid tenglamasidan  $z = \pm \sqrt{1 - \frac{x^2}{25} - \frac{y^2}{16}}$  ekanligini topamiz. Demak,  $z$  ning o‘zgarish sohasi,  $1 - \frac{x^2}{25} - \frac{y^2}{16} \geq 0$  dan iborat. Bu soha,  $\frac{x^2}{25} + \frac{y^2}{16} = 1$  ellips bilan chegaralangan. Ellips tenglamasidan,  $y = \pm 4\sqrt{1 - \frac{x^2}{25}}$  bo‘lishini topamiz. Bundan  $x$  ning  $-5$  dan  $5$  gacha o‘zgarishi kelib chiqadi.  $x \in [-5, 5]$  segmentda o‘zgarganda  $y$  o‘zgaruvchi,  $-4\sqrt{1 - \frac{x^2}{25}}$  dan  $4\sqrt{1 - \frac{x^2}{25}}$  gacha o‘zgaradi.

Agar  $M$  nuqta ellipsning ichida yotsa, uchlari  $-\sqrt{1 - \frac{x^2}{25} - \frac{y^2}{16}}$  va  $\sqrt{1 - \frac{x^2}{25} - \frac{y^2}{16}}$  bo‘lgan qismi ellipsoidning ichida yotadi. Demak, ellipsoid,

$$\begin{cases} -5 \leq x \leq 5, \\ -4\sqrt{1 - \frac{x^2}{25}} \leq y \leq \sqrt{1 - \frac{x^2}{25}}, \\ -\sqrt{1 - \frac{x^2}{25} - \frac{y^2}{16}} \leq z \leq \sqrt{1 - \frac{x^2}{25} - \frac{y^2}{16}} \end{cases}$$

tengsizliklar sistemasi yordamida beriladi.

**16.6-misol.**  $\{M\}$  - tekislikda koordinatalari  $x^2 + y^2 < 25$  tengsizlikni qanoatlantiruvchi nuqtalar to‘plami bo‘lsin. U holda,  $A(3; 4)$  nuqta,  $\{M\}$  to‘plamning limit nuqtasi ekanligini isbotlang.

**Yechilishi.**  $A(3; 4)$  nuqtaning,  $|x - 3| < \delta, |y - 4| < \delta$  ( $0 < \delta < 1$ ) tengsizliklar orqali berilgan ixtiyoriy atrofini olamiz.  $B\left(3 - \frac{\delta}{2}, 4 - \frac{\delta}{2}\right)$  nuqta bu atrofda yotadi va  $\left(3 - \frac{\delta}{2}\right)^2 + \left(4 - \frac{\delta}{2}\right)^2 < 3^2 + 4^2 = 25$  tengsizlik o‘rinli bo‘ladi. Demak,

$B$  nuqta  $\{M\}$  to‘plamga qarashli ekan. Shunday qilib, 16.8-ta’rifga ko‘ra,  $A(3;4)$  nuqta -  $\{M\}$  to‘plamning limit nuqtasi bo‘ladi.

**16.7-misol.** Tekislikda  $y \geq x^2$  tengsizlikni qanoatlantiruvchi barcha nuqtalar to‘plami  $\{M\}$  ning yopiq to‘plam ekanligini isbotlang.

**Yechilishi.** Ma’lumki,  $\{M\}$  to‘plam yopiq bo‘lishi uchun, uning barcha limit nuqtalari o‘ziga qarashli bo‘lishi kerak. Shuning uchun, ixtiyoriy  $A(a;b) \in \{M\}$  nuqta  $\{M\}$  to‘plamning limit nuqtasi bo‘lmasligini ko‘rsatish etarli.  $A(a;b) \in \{M\}$  bo‘lsin. U holda,  $b < a^2$  tengsizlikka ega bo‘lamiz.  $\varepsilon = a^2 - b > 0$  deb olamiz. Shunday  $\delta < \frac{\varepsilon}{2}$  topiladiki,  $|x-a| < \delta$  tengsizlikdan  $|x^2 - a^2| < \frac{\varepsilon}{2}$  bo‘lishi kelib chiqadi. U holda,  $|x-a| < \delta, |y-b| < \delta$  tengsizliklardan

$$x^2 - y = (a^2 - b) + (b - y) + (x^2 - a^2) \geq (a^2 - b) - |b - y| - |x^2 - a^2| > \varepsilon - \frac{\varepsilon}{2} - \frac{\varepsilon}{2} = 0.$$

Demak,  $A$  nuqtaning  $\delta$  atrofi  $\{M\}$  to‘plamga qarashli emas. Shuning uchun,  $A$  nuqta - to‘plamning limit nuqtasi bo‘la olmaydi. Shunday qilib,  $\{M\}$  to‘plam yopiq ekan.

**16.8-misol.** Ushbu  $x^2 + y^2 < 100$  tengsizlik orqali berilgan  $\{M\}$  to‘plamning chegara nuqtalarini toping.

**Yechilishi.** Berilgan tengsizlikni qanoatlantiruvchi nuqtalar to‘plami – markazi koordinatalar boshida, radiusi 10 ga teng bo‘lgan aylananing ichidagi nuqtalar to‘plamidan iborat (aylanadagi nuqtalar  $\{M\}$  to‘plamga qarashli emas).

Geometrik nuqtai nazaridan, ravshanki,  $\{M\}$  to‘plamning chegarasi  $x^2 + y^2 = 100$  aylanadan iborat,  $x^2 + y^2 < 100$  va  $x^2 + y^2 > 100$  tengsizliklar bilan berilgan to‘plamlar ochiq to‘plamlardan iborat. Shuning uchun,  $x^2 + y^2 < 100$  to‘plamning nuqtalari ham  $\{M\}$  to‘plamning chegara nuqtalari bo‘la olmaydi.

Endi  $x^2 + y^2 = 100$  aylananing nuqtalarini qaraymiz.  $\forall A(a;b)$  nuqta shu aylanada yotsin.  $A$  nuqtaning ixtiyoriy atrofini qaraymiz. Bu atrofdan koordinatalari  $|x| < |a|, |y| < |b|$  tengsizliklarni va  $|x| > |a|, |y| > |b|$  tengsizliklarni qanoatlantiruvchi  $B(x,y)$  nuqtalar mavjud. Birinchi tengsizliklarni qanoatlantiruvchi nuqtalar uchun,  $x^2 + y^2 < a^2 + b^2 = 100$ , ikkinchi tengsizliklarni qanoatlantiruvchi nuqtalar uchun  $x^2 + y^2 > 100$ .

Demak  $A(a;b)$  nuqta  $\{M\}$  to‘plam uchun, 16.4-ta’rifga ko‘ra, chegara nuqta bo‘ladi. Ma’lumki, berilgan to‘plamning hamma chegara nuqtalari, uning chegarasi bo‘ladi.

**16.9-misol.**  $\{M\}$  - tekislikda ikkala koordinatalari ham rasional bo'lgan nuqtalar to'plami bo'lsin. U holda tekislikdagi ixtiyoriy  $A(a; b)$  nuqta  $\{M\}$  to'plamning limit nuqtasi bo'lishini isbotlang.

**Yechilishi.**  $A(a; b)$  nuqtaning ixtiyoriy  $|x-a|<\delta, |y-b|<\delta$  atrofini qaraymiz.  $a$  dan farqli shunday  $r_1$  rasional son topiladiki,  $|r_1-a|<\delta$  xuddi shunday,  $b$  dan farqli  $r_2$  shunday rasional son topiladiki,  $|r_2-b|<\delta$  bo'ladi.

U holda,  $B(r_1; r_2)$  nuqta  $\{M\}$  to'plamga qarashli bo'lib, u  $A(a; b)$  nuqtaning belgilangan atrofida yotadi ( $B(r_1; r_2) \neq A(a; b)$ ). Demak,  $A$  ning ixtiyoriy atrofida  $\{M\}$  to'plamning  $A$  dan farqli nuqtasi mavjud ekan. Shuning uchun, 16.8- ta'rifga ko'ra,  $A(a; b)$  nuqta,  $\{M\}$  to'plamning limit nuqtasi bo'ladi.

### Mustaqil yechish uchun misollar

Quyidagi tengsizliklar bilan berilgan nuqtalar to'plamining geometrik o'rnini aniqlang:

$$16.1. y \leq 2x + 4.$$

$$16.2. y^2 \geq 6x..$$

$$16.3. (x-4)^2 + (y+6)^2 \leq 25.$$

$$16.4. x^2 + 6x + y^2 - 2y - 26 > 0.$$

$$16.5. \begin{cases} x^2 + y^2 > 9, \\ x^2 + y^2 < 16. \end{cases}$$

$$16.6. \begin{cases} 0 < x^2 + y^2 < 25, \\ y > 2x^2. \end{cases}$$

16.7. A to'plam,  $x^2 + y^2 \geq 1$  tengsizlik,  $B - x^2 + y^2 \leq 4$  tengsizlik,  $D - y \leq 8 - x^2$  tengsizlik,  $C - y \geq x^2$  tengsizlik bilan aniqlanganda,  
a)  $(A \cup B) \cap (C \cup D)$ , b)  $(A \cap B) \cup (C \cap D)$ ,

to'plamlarning geometrik o'rnini aniqlang.

16.8.  $x^2 - 4x + y^2 + 6y = 0$  aylana va  $x + 2y + 1 = 0$  to'g'ri chiziq bilan chegaralangan aylanma segmentning nuqtalari to'plamini tengsizliklar sistemasi yordamida ifodalang.

16.9. Uchlari,  $A(-1; 2), B(3; 7), C(6; 4), D(0; -2)$  nuqtalarda bo'lgan to'rburchakning nuqtalari to'plamini tengsizliklar sistemasi yordamida ifodalang.

16.10. Uchlari  $A(-3; 1), B(2; 4), C(6; 2), D(1; -1)$  nuqtalarda bo'lgan  $ABCD$  parallelogramning nuqtalari to'plamini tengsizliklar sistemasi yordamida ifodalang.

16.11.  $y = x^2 - 6$  paraboladan  $y = 2x + 1$  to'g'ri chiziq yordamida kesib olingan segmentning nuqtalari to'plamini tengsizliklar sistemasi yordamida ifodalang.

**16.12.** Tekislikda  $x - 3y + 4 = 0$  to‘g‘ri chiziqdan yuqorida, markazi  $M_0(2; -1)$  nuqtada, radiusi 10 ga teng bo‘lgan doiradan tashqarida joylashgan nuqtalar to‘plamini tengsizliklar sistemasi yordamida ifodalang.

**16.13.** Ushbu  $\frac{x^2}{25} + \frac{y^2}{16} = 1$  ellipsda va uning ichida yotgan nuqtalar, uchlari  $A(0; 5)$ ,  $B(-3; 6)$ ,  $C(3; 0)$  nuqtalarda bo‘lgan uchburchakning nuqtalari hamda  $y = x^2$  paraboladan yuqorida yotgan nuqtalar to‘plamining umumiy qismidan iborat bo‘lgan, uchta to‘plamning nuqtalari to‘plamini tengsizliklar sistemasi yordamida ifodalang.

Quyidagi berilgan to‘plamlarni bitta yoki bir nechta,  
 $\begin{cases} a \leq x \leq b \\ \varphi(x) \leq y \leq \psi(x) \end{cases}$  ko‘rinishdagi tengsizliklar sistemasi yordamida ifodalang:

**16.14.** Tomonlari:  $x = 3$ ,  $x = 5$ ,  $3x - 2y + 4 = 0$ ,  $6x - 4y + 2 = 0$  bo‘lgan parallelogram.

**16.15.**  $x \geq 0$ ,  $y \geq 0$ ,  $x^2 + y^2 \leq 4$  tengsizliklar bilan berilgan soha.

**16.16.**  $\frac{x^2}{25} + \frac{y^2}{16} \leq 1$  – ellipsning ichki qismi.

**16.17.**  $y = x^2$ ,  $y = \sqrt{x}$  parabolalar bilan chegaralangan soha.

**16.18.**  $y^2 = 6x$  parabola va  $x = 2$  to‘g‘ri chiziq bilan chegaralangan soha.

**16.19.**  $x = 2$ ,  $y = x$  to‘g‘ri chiziqlar va  $xy = 1$  giperbola bilan chegaralangan soha.

Fazoda tengsizlik yoki tengsizliklar sistemasi yordamida berilgan nuqtalar to‘plamining geometrik o‘rnini aniqlang:

$$\begin{cases} x > 0, \\ y > 0, \\ z > 0. \end{cases}$$

**16.21.**  $xyz > 0$ .

**16.22.**  $x^2 + y^2 + z^2 \leq 9$ .

**16.23.**  $4 \leq x^2 + y^2 + z^2 \leq 16$ .

$$\begin{cases} x^2 + y^2 + z^2 < 25, \\ x^2 + y^2 < 3. \end{cases}$$

**16.25.** Fazodagi  $A(4; 1; 5)$  nuqtadan  $2x + 6y + 3z - 12 = 0$  tekislikka parallel tekislik o‘tkazilgan. Aylanma paraboloidni shu tekislik bilan kesganda hosil bo‘lgan sohani tengsizliklar sistemasi orqali ifodalang.

Quyidagi berilgan to‘plamlarni:

$$\begin{cases} a \leq x \leq b, \\ \varphi(x) \leq y \leq \psi(x) \\ \Phi(x, y) \leq z \leq \Psi(x, y) \end{cases}$$

tengsizliklar sistemasi ko'rinishida ifodalang.

**16.26.**  $\frac{x^4}{25} + \frac{y^4}{16} + \frac{z^4}{9} = 1$  sirt bilan chegaralangan soha.

**16.27.**  $\left(\frac{x^2}{a^2} + \frac{y^2}{b^2}\right)^2 + \frac{z^2}{c^2} = 1$  sirt bilan chegaralangan soha.

**16.28.**  $x = 0, y = 0, z = 0, x = 2, y = 4, x + y + z = 8$  tekisliklar bilan chegaralangan soha.

**16.29.**  $2az = x^2 + y^2$  paraboloid va  $x^2 + y^2 + z^2 = 3a^2$  shar bilan chegaralangan soha.

**16.30.**  $x^2 + y^2 + z^2 = R^2$  shar va  $x^2 = y^2 + z^2 (y > 0)$  konus bilan chegaralangan soha.

**16.31.**  $\{M\}$  - tekislikdagi ikkala koordinatasi ham irrasional bo'lgan nuqtalar to'plami bo'lsin. U holda, tekislikning ixtiyoriy  $A(a; b)$  nuqtasi,  $\{M\}$  to'plamning limit nuqtasi ekanligini isbotlang.

**16.32.**  $\{M\}$  - tekislikda absissasi rasional, ordinatasi esa, irrasional bo'lgan barcha nuqtalar to'plami bo'lsin. U holda, tekislikning ixtiyoriy  $A(a; b)$  nuqtasi  $\{M\}$  to'plamning limit nuqtasi ekanligini isbotlang.

**16.33.** Tekislikning  $A\left(\frac{1}{m}; \frac{1}{n}\right)$  ( $m, n = 1, 2, \dots$ ) ko'rinishdagi barcha nuqtalaridan iborat bo'lgan  $\{M\}$  to'plamning limit nuqtalarini toping. Koordinatalar boshi  $\{M\}$  to'plamning limit nuqtasi bo'ladimi?

**16.34.**  $A(3; 4)$  va  $B(-1; 2)$  nuqtalar va faqat shu nuqtalar limit nuqtalari bo'lgan, hech bo'lmaganda, bitta to'plam tuzing.

**16.35.** Hamma limit nuqtalari faqat  $A(0; n)$  ( $n$  - butun son) ko'rinishda bo'lgan to'plamni tuzing.

**16.36.** Ikkita ochiq to'plamlarning yig'indisi ochiq to'plam ekanligini isbotlang.

**16.37.** Ikkita yopiq to'plamlarning yig'indisi yopiq to'plam ekanligini isbotlang.

**16.38.** Koordinatalari quyidagi  $x + y > 5, x^2 + y^2 < 100$  tengsizliklarni qanoatlantiradigan nuqtalar to'plamining ochiq to'plam ekanligini isbotlang.

**16.39.** Koordinatalari ushbu  $x + y \geq 5, x^2 + y^2 \leq 100$  tengsizliklarni qanoatlantiradigan nuqtalar to'plamining yopiq to'plam ekanligini isbotlang.

Quyidagi tengsizliklar orqali aniqlangan to‘plamlarning qaysi biri soha bo‘ladi?

**16.40.**  $4 < x^2 + y^2 < 25$ .

**16.41.**  $\begin{cases} 4 < x^2 + y^2 < 10, \\ -1 < y < 1. \end{cases}$

### Mustaqil yechish uchun misollarning javoblari

**16.1.**  $y = 2x + 4$  to‘g‘ri chiziq va undan pastdagи nuqtalar.

## 17-§. Ko‘p o‘zgaruvchili funksiya tushunchasi va uning aniqlanish sohasi

$\{M\}$  ( $\{M\} \subset R^2$ ) to‘plam berilgan bo‘lsin.

**17.1-ta’rif.**  $\{M\}$  to‘plamning har bir  $M(x, y)$  nuqtasiga biror qonun yoki qoida yordamida  $u$  son ( $u \in R$ ) mos qo‘yilgan bo‘lsa,  $\{M\}$  to‘plamda ikki o‘zgaruvchili  $u = u(M)$  yoki  $u = f(M) = f(x, y)$  funksiya aniqlangan deyiladi. Bunda  $\{M\}$  to‘plam-funksiyaning aniqlanish sohasi,  $\{u\}$  to‘plam esa, funksiyaning *qiymatlar to‘plami* yoki o‘zgarish sohasi deyiladi.

$\{M\} \subset R^m$  to‘plam berilgan bo‘lsin.

**17.2-ta’rif.**  $\{M\}$  to‘plamning har bir  $M(x_1, x_2, \dots, x_m)$  nuqtasiga biror qonun yoki qoida yordamida biror  $u$  son ( $u \in R$ ) mos qo‘yilgan bo‘lsa,  $\{M\}$  to‘plamda  $m$  o‘zgaruvchili funksiya aniqlangan deyiladi va  $u = u(M)$  yoki  $u = f(M) = f(x_1, x_2, \dots, x_m)$  kabi belgilanadi. Bunda  $\{M\}$  to‘plam funksiyaning aniqlanish sohasi deyiladi.  $\{u\}$  to‘plam esa, uning *qiymatlar to‘plami* yoki o‘zgarish sohasi deyiladi. Bundan buyon, funksiyaning aniqlanish sohasini  $D(f)$ , o‘zgarish sohasini esa,  $E(f)$  orqali belgilaymiz.

**17.3-ta’rif.**  $f(M) = f(x_1, x_2, \dots, x_m) = C$  ( $C \in R$ ) shartni qanoatlantiruvchi  $M \in E$  ( $E \subset R^m$ ) nuqtalar to‘plamiga,  $f(M)$  funksiyaning  $c -$  sathi deyiladi. Ko‘p hollarda, ikki o‘zgaruvchili  $f(x, y)$  funksiyaning  $c -$  sathi, *sath chiziq‘i*, uch o‘zgaruvchili  $f(x, y, z)$  funksiyaning  $c -$  sathi esa, *sath sirti* deb yuritiladi.

$u = f(M)$  funksiya  $E$  sohada ( $M \in E \subset R^m$ ) berilgan bo‘lsin.

**17.4-ta’rif.** Agar  $\forall M \in E, \lambda M \in E, \lambda \in R$  uchun

$$f(\lambda M) = f(\lambda x_1, \lambda x_2, \dots, \lambda x_m) = \lambda^m f(x_1, x_2, \dots, x_m)$$

tenglik o‘rinli bo‘lsa, u holda  $f(M) - \alpha$  darajali *birjinsli funksiya* deyiladi.

Agar yuqoridagi shartlarda  $f(\lambda M) = |\lambda|^m f(M)$  tenglik o‘rinli bo‘lsa,  $f(M) - m -$  darajali *musbat birjinsli funksiya* deyiladi.

Masalan,  $f(x) = x$ ,  $x \in R$ , 1- darajali birjinsli funksiya,  $f(x) = |x|$ ,  $x \in R$ , 1- darajali *musbat birjinsli fusnksiyadir*.

**17.1-misol.** Quyida berilgan funksiyalarning aniqlanish sohasi va o‘zgarish sohasini toping:

$$1) u = \sqrt{16 - x^2 - y^2}; 2) u = \ln xy; 3) u = x_1^2 + x_2^2 + \dots + x_m^2.$$

**Yechilishi.** 1) Berilgan funksiya tekislikning koordinatalari  $16 - x^2 - y^2 \geq 0$  tengsizlikni qanoatlantiradigan  $M(x, y)$  nuqtalar to‘plamida

aniqlangan. Bu tengsizlik,  $x^2 + y^2 \leq 16$  tengsizlikka teng kuchli. Oxirgi tengsizlik, markazi  $M_0(0,0)$  nuqtada, radiusi 4 ga teng bo'lgan doirani ifoda qiladi. Demak, funksiyaning aniqlanish sohasi  $D(u)$ : tekislikdagi markazi koordinatalar boshida, radiusi esa, 4 ga teng bo'lgan yopiq doiradan, qiymatlar to'plami yoki o'zgarish sohasi  $E(u)$ :  $[0;4]$ -segmentdan iborat ekan.

2)  $u = \ln xy$  funksiya, tekislikning koordinatalari  $xy > 0$  tengsizlikni qanoatlantiradigan  $M(x,y)$  nuqtalar to'plamidan iborat. Oxirgi tengsizlik, a)  $x > 0, y > 0$ ; b)  $x < 0, y < 0$  tengsizliklar sistemasiga teng kuchli.

Demak, berilgan funksiyaning aniqlanish sohasi, koordinatalar tekisligining birinchi va uchinchi choraklaridan iborat (koordinatalar o'qlari kirmaydi), o'zgarish sohasi  $E(u)$  esa,  $-\infty < u < \infty$  son o'qidan iborat.

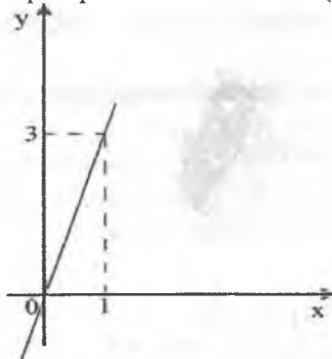

3)  $u = x_1^2 + x_2^2 + \dots + x_m^2$  funksiya  $R^m$  fazoda aniqlangan bo'lib, uning o'zgarish sohasi,  $[0, \infty)$  dan iborat.

**17.2-misol.** Quyida berilgan funksiyalarning aniqlanish sohasi toping va uni chizmada ko'rsating.

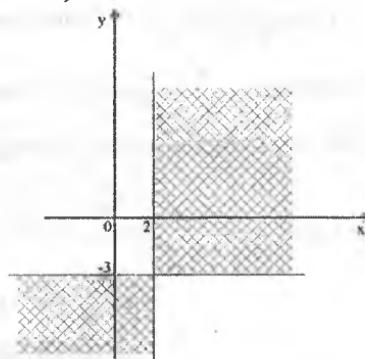

$$1) \quad u = \frac{x+y}{3x-y}; \quad 2) \quad u = \sqrt{(x-2)(y+3)}, \quad 3) \quad u = \ln x - \ln y;$$

$$4) \quad u = \sqrt{\frac{x^2 + y^2 - x}{2x - x^2 - y^2}}; \quad 5) \quad u = \frac{x^2 + y - z}{\sqrt{9 - x^2 - y^2 - z^2}}.$$

**Yechilishi.** 1)  $u = \frac{x+y}{3x-y}$  funksiya,  $x$  va  $y$  o'zgaruvchilarning, kasrning maxrajini nolga aylantirmaydigan qiyatlari to'plamida aniqlangan, ya'ni  $D(u)$  butun tekislikning  $y = 3x$  to'g'ri chiziqdandan tashqari qismidan iborat ekan (17.1-chizma).

17.1-chizma.

17.2-chizma.

**Yechilishi.** 1)  $u = xy$  funksiyaning sath chiziqlari oilasi -  $x$  va  $y$  larning,  $xy = C$  tenglamani qanoatlantiradigan  $(x, y)$  qiymatlari to‘plamidan iborat bo‘ladi, bunda  $C \in R$ .  $C$  ga har xil qiymatlar berish natijasida, har xil sath chiziqlarini hosil qilamiz. Masalan,  $C = 1, 2, \dots, n$  qiymatlarda  $xy = 1, xy = 2, \dots, xy = n$ , birinchi va uchinchi choraklarda joylashgan giperboloidlar oilasini;  $C = -1, -2, \dots, -n$  qiymatlarda esa,  $xy = -1, xy = -2, \dots, xy = -n$  ikkinchi va to‘rtinchchi choraklarda joylashgan giperboloidlar oilasini hosil qilamiz.  $c = 0$  da  $xy = 0$ , ya’ni sath chiziqlari  $x = 0$  va  $y = 0$  to‘g‘ri chiziqlardan iborat bo‘ladi.

2)  $u = \sqrt{y-x}, \sqrt{y-x} = C$ , bundan  $y = x + C^2$ . Demak, berilgan  $u = \sqrt{y-x}$  funksiyaning sath chizig‘i,  $C \geq 0$  bo‘lganda,  $(0; C^2)$  va  $(1; 1+C^2)$  nuqtalardan o‘tuvchi to‘g‘ri chiziqdan,  $C < 0$  bo‘lganda esa,  $\phi$  - bo‘sh to‘plamdan iborat.

3)  $\sqrt{36-4x^2-9y^2} = C$ ,  $36-4x^2-9y^2 = C^2$ ,  $4x^2+9y^2 = 36-C^2$ . Agar  $C \in [0; 6]$  bo‘lsa, berilgan funksiyaning sath chizig‘i- markazi  $(0; 0)$  nuqtada, fokusi  $Ox$  o‘qda, yarim o‘qlari esa, mos ravishda,  $\frac{\sqrt{36-C^2}}{2}, \frac{\sqrt{36-C^2}}{3}$  bo‘lgan ellipsdan;  $C = 6$  bo‘lganda,  $(0; 0)$  nuqtadan;  $C \notin [0; 6]$  bo‘lganda,  $\phi$  - bo‘sh to‘plamdan iborat bo‘ladi.

$$4) \frac{2z}{x^2+y^2+z^2} = C, x^2+y^2+\left(z-\frac{1}{C}\right)^2 = \frac{1}{C^2}$$

Agar  $C \neq 0$  bo‘lsa, u holda, berilgan funksiyaning sath sirti – radiusi  $\frac{1}{|C|}$ , markazi  $\left(0; 0; \frac{1}{C}\right)$  nuqtada bo‘lgan sferadan  $((0; 0; 0)$  nuqtadan tashqari) iborat; agar  $C = 0$  bo‘lsa,  $(0; 0; 0)$  nuqtadan tashqari  $z = 0$  tekislikdan iborat bo‘ladi.

**17.5-misol.** Ushbu  $u = x^{\sqrt{2}} \sin \frac{y}{x} + y^{\sqrt{2}} \cos \frac{x}{y}$  funksiyaning birjinsli ekanligini isbotlang va uning birjinslilik darajasini toping.

**Yechilishi.**  $x$  ni  $\lambda x$  ga,  $y$  ni  $\lambda y$  ga almashtirib, topamiz:

$$\begin{aligned} u &= (\lambda x)^{\sqrt{2}} \sin \frac{(\lambda y)}{(\lambda x)} + (\lambda y)^{\sqrt{2}} \cos \frac{(\lambda x)}{(\lambda y)} = \lambda^{\sqrt{2}} \cdot x^{\sqrt{2}} \cdot \sin \frac{y}{x} + \lambda^{\sqrt{2}} \cdot y^{\sqrt{2}} \cos \frac{x}{y} = \\ &= \lambda^{\sqrt{2}} \left( x^{\sqrt{2}} \cdot \sin \frac{y}{x} + y^{\sqrt{2}} \cdot \cos \frac{x}{y} \right) = \lambda^{\sqrt{2}} \cdot u. \end{aligned}$$

Demak, 17.4-ta’rifga ko‘ra, berilgan funksiya birjinsli va uning birjinslilik darajasi  $\lambda = \sqrt{2}$ .

**17.5-misol.** Ushbu  $u = \frac{xy + zt}{xyz + yzt}$  funksiyaning birjinsli ekanligi isbotlang va uning birjinslilik darajasini toping.

**Yechilishi.**  $x$  ni  $\lambda x$  ga,  $y$  ni  $\lambda y$  ga,  $z$  ni  $\lambda z$  ga,  $t$  ni  $\lambda t$  ga almash tirib, topamiz:

$$u = \frac{\lambda x \cdot \lambda y + \lambda z \cdot \lambda t}{\lambda x \cdot \lambda y \cdot \lambda z + \lambda y \cdot \lambda z \cdot \lambda t} = \frac{\lambda^2 xy + \lambda^2 zt}{\lambda^3 xyz + \lambda^3 yzt} = \frac{1}{\lambda} \cdot \frac{xy + zt}{xyz + yzt} = \lambda^{-1} u.$$

Demak, berilgan funksiya birjinsli va uning bir jinslilik darjasidagi  $\lambda = -1$ .

### Mustaqil yechish uchun misollar

Quyidagi funksiyaning aniqlanish sohasini toping va chizmasini chizing:

$$17.1. \quad u = \sqrt{1 - x^2 - y^2}.$$

$$17.2. \quad u = \sqrt{1 - x^2} + \sqrt{y^2 - 1}.$$

$$17.3. \quad u = \frac{1}{x+y}.$$

$$17.4. \quad u = \frac{x}{\sqrt{x-y}} + \frac{y}{\sqrt{x+y}}.$$

$$17.5. \quad u = \arccos \frac{x^2 + y^2}{9}.$$

$$17.6. \quad u = \ln(y^2 - 4x + 8)$$

$$17.7. \quad u = \sqrt{R^2 - x^2 - y^2} + \frac{1}{\sqrt{x^2 + y^2 - r^2}}.$$

$$17.8. \quad u = \frac{\sqrt{4x - y^2}}{\ln(1 - x^2 - y^2)}.$$

$$17.9. \quad u = \sqrt{(x^2 + y^2 - 1)(4 - x^2 - y^2)}.$$

$$17.10. \quad u = \sqrt{\frac{x^2 + y^2 - x}{2x - x^2 - y^2}}.$$

Quyidagi funksiyaning aniqlanish sohasini toping:

$$17.11. \quad u = \ln(1 - x - y - z).$$

$$17.12. \quad u = \frac{1}{\sqrt{1 - x^2 - y^2 - z^2}}.$$

$$17.13. \quad u = \arccos \frac{z}{\sqrt{x^2 + y^2}}.$$

$$17.14. \quad u = \sqrt{8 - x^2 - 2y^2 - 4z^2}.$$

$$17.15. \quad u = \frac{1}{\sqrt{x}} + \frac{1}{\sqrt{y}} + \frac{1}{\sqrt{z}}.$$

$$17.16. \quad u = \arcsin \frac{x}{a} + \arcsin \frac{y}{b} + \arcsin \frac{z}{c}.$$

$$17.17. \quad u = xy + \sqrt{\ln \frac{9}{x^2 + y^2} + \sqrt{x^2 + y^2 - 9}}.$$

$$17.18. \quad u = \frac{1}{\sqrt{z - x^2 - y^2}}.$$

$$17.19. \quad u = \sqrt{2(x^2 + y^2 + z^2) - (x^2 + y^2 + z^2)^2 - 1}.$$

$$17.20. \quad u = \frac{\ln x + \ln z}{\sqrt{y-1}} + \ln(5 - x - y - z).$$

Quyidagi  $u = f(x, y)$  funksiyaning  $(x, y) \in E$  to‘plamdagisi qiyamatlari to‘plamini ( $o‘zgarish sohasi$ ) toping  $((x, y) \in E \subset R^2)$ :

$$17.21. \quad u = x - 2y - 3; \quad E = \{(x, y); x + y = 1, x \geq 0, y > 0\}.$$

$$17.22. \quad u = x^2 - xy + y^2, E = \{(x, y) : |x| + |y| = 1\}.$$

$$17.23. \quad u = x^2 + y^2 - 12x + 16y + 25, E = \{(x, y) : x^2 + y^2 = 25\}$$

$$17.24. \quad u = \ln(2x^2 + 3y^2), E = \{(x, y) : x + y = 2, x \geq 0, y \geq 0\}.$$

Quyidagi funksiyaning sath chiziqlarini toping:

$$17.25. \quad u = y - x.$$

$$17.26. \quad u = \sqrt{y - x}.$$

$$17.27. \quad u = x^2 + y^2.$$

$$17.28. \quad u = x^2 - y^2.$$

$$17.29. \quad u = \frac{1}{\sqrt{x^2 - y^2}}.$$

$$17.30. \quad z = \frac{1}{x^2 + 2y^2}.$$

$$17.31. \quad u = \sqrt{y - \sin x}.$$

Quyidagi misollarda berilgan funksiyaning aniqlanish va o'zgarish sohalarini toping hamda uning sath chiziqlarini aniqlang. Sath chiziqlaridan birini chizing:

$$17.32. \quad f(x, y) = 9x^2 + y^2.$$

$$17.33. \quad f(x, y) = \frac{1}{xy}.$$

Quyidagi funksiyaning sath sirtlarini toping.

$$17.34. \quad u = x + y + z.$$

$$17.35. \quad u = x^2 + y^2 + z^2.$$

$$17.36. \quad u = \frac{1}{x^2 + y^2 + z^2 + 2x}.$$

$$17.37. \quad u = \ln(x^2 + y^2 + z^2)$$

$$17.38. \quad u = \frac{2z}{x^2 + y^2 + z^2}. \quad 17.39. \quad u = \sqrt{(x+1)^2 + y^2 + z^2} + \sqrt{(x-1)^2 + y^2 + z^2}.$$

Quyidagi misollarda berilgan funksiyaning aniqlanish va o'zgarish sohalarini toping hamda uning sath sirtlarini aniqlang. Sath sirtlaridan birini chizing:

$$17.40. \quad f(x, y, z) = x^2 + y^2 - z.$$

$$17.41. \quad g(x, y, z) = \frac{1}{x^2 + y^2 + z^2}.$$

Quyidagi funksiyani bir jinslilikka tekshiring va uning birjinslilik darajasini toping:

$$17.42. \quad u = \frac{\sqrt{x^2 + y^2}}{x}, \quad x > 0.$$

$$17.43. \quad u = \frac{x^2 - 3xy + y^2}{\sqrt{x^2 + 2xy - y^2}}.$$

$$17.44. \quad u = \sqrt[6]{x^6 z^2 + 2x^3 y^4 z + xy^2 \cdot z^5}. \quad 17.45. \quad 4) \quad u = \sqrt{x^2 + y^2 + z^2 - t^2}.$$

$$17.46. \quad u = \frac{xy + zt}{xyz + yzt}.$$

$$17.47. \quad u = \sum_{i=1}^{n-1} x_i^r (\ln x_{i+1} - \ln x_i).$$

$$17.48. \quad u = x^2 y + z^2 + yz.$$

17.49.  $x, y$  o'zgaruvchilarning har qanday  $\lambda$  juft darajali birjinsli funksiyasini,  $f(x, y) = |x|^{\lambda} \varphi\left(\frac{y}{x}\right)$  ko'rinishda tasvirlash mumkinligini ko'rsating.

**17.50.**  $x, y$  o'zgaruvchilarning har qanday  $\lambda$  toq darajali bir jinsli funksiyasini  $f(x, y) = |x|^{k-1} x \varphi\left(\frac{y}{x}\right)$  ko'rinishda tasvirlash mumkinligini ko'rsating.

**17.51.** Ushbu  $f(x, y, z) = |x|^k \varphi\left(\frac{y}{x}, \frac{z}{x}\right)$  funksiyaning  $\lambda$  juft darajali birjinsli ekanligini isbotlang.

**17.52.**  $x, y, z$  o'zgaruvchilarning har qanday toq darajali birjinsli funksiyasini  $f(x, y, z) = |x|^{k-1} x \cdot f\left(\frac{y}{x}, \frac{z}{x}\right)$  ko'rinishda tasvirlash mumkinligini isbotlang.

### Mustaqil yechish uchun misollarning javoblari

**17.1.** Markazi  $(0;0)$  nuqtada, radiusi 1 ga teng bo'lgan yopiq doira.

**17.2.**  $|x| \leq 1, |y| \geq 1$ .    **17.3.**  $y = -x$  to'g'ri chiziq nuqtalaridan tashqari tekislikning hamma nuqtalari.    **17.4.** Burchak bissektrisalari bilan chegaralangan o'ng vertikal burchakning ichki qismi.    **17.5.** Markazi koordinatalar boshida, radiusi 3 ga teng bo'lgan doira.    **17.6.** Uchi  $(2;0)$  nuqtada va fokusi  $(3;0)$  nuqtada bo'lgan parabolaning tashqi qismi.    **17.7.** Tekislikning  $x^2 + y^2 = R^2$  va  $x^2 + y^2 = r^2$  aylanalar orasidagi qismi.    **17.8.** Tekislikning  $y^2 = 4x$  parabolaning ichi bilan  $x^2 + y^2 = 1$  aylana orasidagi qismi (parabola yoyi kiradi, aylana yoyi kirmaydi).    **17.9.**  $1 \leq x^2 + y^2 \leq 4$  - halqa.    **17.10.**  $x \leq x^2 + y^2 < 2x$  - oycha.    **17.11.**

## 18-§. $R^m$ fazoda sonlar ketma-ketligi va uning limiti

$R^m$  fazo va  $N$ -natural sonlar to'plami berilgan bo'lsin. Har bir  $n$  ( $n \in N$ ) natural songa, biror qonun yoki qoida yordamida,  $R^m$  fazoning

biror muayyan  $M_n = M_n(x_1^{(n)}, x_2^{(n)}, \dots, x_m^{(n)})$  ( $M_n \subset R^m$ ) nuqtasi mos qo'yilgan, ya'ni

$$1 \rightarrow M_1(x_1^{(1)}, x_2^{(1)}, \dots, x_m^{(1)}), \\ 2 \rightarrow M_2(x_1^{(2)}, x_2^{(2)}, \dots, x_m^{(2)}),$$

$$\dots \dots \dots \\ n \rightarrow M_n(x_1^{(n)}, x_2^{(n)}, \dots, x_m^{(n)})$$

bo'lsa,  $R^m$  fazoda  $M_1, M_2, \dots, M_n, \dots$  sonlar ketma - ketligi aniqlangan deyiladi va qisqacha  $\{M_n\}$  ( $M_n \subset R^m$ ) kabi belgilanadi.

*Misollar:* 1)  $M_n = M_n\left(\frac{1}{n}, \frac{1}{n}\right): M_1(1,1), M_2\left(\frac{1}{2}, \frac{1}{2}\right), \dots, M_n\left(\frac{1}{n}, \frac{1}{n}\right), \dots$

2)  $M_n = M_n\left(0, \frac{1}{n}\right): M_1(0,1), M_2\left(0, \frac{1}{2}\right), \dots, M_n\left(0, \frac{1}{n}\right), \dots,$

3)  $M_n = M_n\left(\frac{1}{n}, 0, \frac{1}{n}\right): M_1(1,0,1), M_2\left(\frac{1}{2}, 0, \frac{1}{2}\right), \dots, M_n\left(\frac{1}{n}, 0, \frac{1}{n}\right), \dots$

Bu ketma-ketliklarning birinchi va ikkinchisi,  $R^2$  fazoning nuqtalaridan, uchinchisi esa,  $R^3$  fazoning nuqtalaridan tashkil topgan sonlar ketma-ketliklaridir.

$R^m$  fazoda

$$M_1, M_2, \dots, M_n, \dots \quad (18.1)$$

sohalar ketma-ketligi va  $A = A(a_1, a_2, \dots, a_m) \in R^m$  nuqta berilgan bo'lsin.

**18.1-ta'rif.** Agar  $\forall \varepsilon > 0$  olinganda ham, shunday  $n_0 \in N$  topilsaki, barcha  $n > n_0$  lar uchun

$$\rho(M_n, A) < \varepsilon \quad (18.2)$$

tengsizlik bajarilsa,  $A$  nuqta  $\{M_n\}$  ketma-ketlikning limiti deyiladi va  $\lim_{n \rightarrow \infty} M_n = A$  yoki  $n \rightarrow \infty$  da  $M_n \rightarrow A$  kabi belgilanadi.

Agar (18.1) ketma-ketlik limitga ega bo'lsa, u, *yaqinlashuvchi ketma-ketlik* deyiladi. Limit ta'rifidagi shartni qanoatlantiruvchi  $A$  nuqta mavjud bo'lmasa,  $\{M_n\}$  ketma-ketlik limitga ega emas deyiladi, ketma-ketlikning o'zi esa, *uzoqlashuvchi* deb ataladi. Ketma-ketlikning limiti ta'rifidagi  $\varepsilon$  ixtiyoriy musbat son bo'lib, izlanayotgan  $n_0$  ( $n_0 \in N$ ) esa, shu  $\varepsilon$  ga bog'liq ravishda topiladi, shuning uchun, ba'zi hollarda,  $n_0 = n_0(\varepsilon)$  kabi yoziladi.

**18.1-misol.**  $R^2$  fazoda berilgan  $\{M_n\} = \left\{ M_n\left(\frac{3}{n}, \frac{1}{n^2}\right) \right\}$  ketma-ketlikning

limiti  $A = A(0; 0)$  ekanligini ko'rsating.

**Yechilishi.**  $\forall \varepsilon > 0$  sonni olaylik. Berilgan  $\varepsilon$  ga ko'ra,  $n_0 = \left\lceil \frac{\sqrt{10}}{\varepsilon} \right\rceil + 1$  desak, unda  $\forall n > n_0$  lar uchun,

$$\begin{aligned}\rho(M_n; A) &= \rho\left(M_n\left(\frac{3}{n}, \frac{1}{n^2}\right); A(0,0)\right) = \sqrt{\left(\frac{3}{n} - 0\right)^2 + \left(\frac{1}{n^2} - 0\right)^2} = \sqrt{\frac{9}{n^2} + \frac{1}{n^4}} < \sqrt{\frac{10}{n^2}} = \\ &= \frac{\sqrt{10}}{n} < \frac{\sqrt{10}}{n_0} = \frac{\sqrt{10}}{\left\lceil \frac{\sqrt{10}}{\varepsilon} \right\rceil + 1} < \varepsilon\end{aligned}$$

tengsizlik bajariladi. Demak,  $\rho(M_n; A) < \varepsilon$ . 18.1-ta'rifga ko'ra,

$$\lim_{n \rightarrow \infty} M_n = \lim_{n \rightarrow \infty} \left( \frac{3}{n}, \frac{1}{n^2} \right) = A(0, 0)$$

bo'ladi.

**18.2-misol.**  $R^2$  fazoda, berilgan  $\{M_n\} = \{M_n((-1)^{n+1}, (-1)^{n+1})\}$  ketma-ketlikning limiti mavjud emasligini ko'rsating.

**Yechilishi.** Teskarisidan faraz qilaylik, ya'ni berilgan ketma-ketlik limitga ega va uning limiti  $A = A(a_1, a_2)$  bo'lsin. Limitning ta'rifiga ko'ra,

$\forall \varepsilon > 0$ , jumladan,  $\varepsilon = 1$  uchun shunday  $n_0 \in N$  nomer topiladiki,  $\forall n > n_0$  dan boshlab,

$$\rho((1; 1), (a_1; a_2)) < \varepsilon, \quad \rho((-1; -1), (a_1; a_2)) < \varepsilon$$

tengsizliklar bajariladi. Bu tengsizliklar yordamida

$$2\sqrt{2} = \rho((1; 1), (-1; -1)) \leq \rho((1; 1), (a_1; a_2)) + \rho((-1; -1), (a_1; a_2)) < \varepsilon + \varepsilon = 2\varepsilon = 2 \quad (\varepsilon = 1)$$

ziddiyatni hosil qilamiz.

Bu ziddiyatga sabab, qaralayotgan ketma-ketlik limitga ega, degan farazimizdir. Demak, berilgan ketma-ketlik limitga ega emas.

**18.1-teorema.**  $R^m$  fazoda  $\{M_n(x_1^{(n)}, x_2^{(n)}, \dots, x_m^{(n)})\}$  ketma-ketlikning  $A = A(a_1, a_2, \dots, a_m) \in R^m$  limitga ega bo'lishi, ya'ni  $\lim_{n \rightarrow \infty} M_n = A$  uchun, bir vaqtda

$$\lim_{n \rightarrow \infty} x_i^{(n)} = a_i$$

$$\dots\dots\dots$$

$$\lim_{n \rightarrow \infty} x_m^{(n)} = a_m$$

bo'lishi zarur va yetarli. Bundan,

$$\lim_{n \rightarrow \infty} M_n = A \Rightarrow \begin{cases} \lim_{n \rightarrow \infty} x_1^{(n)} = a_1 \\ \dots\dots\dots \\ \lim_{n \rightarrow \infty} x_m^{(n)} = a_m \end{cases}$$

ekanligi kelib chiqadi.

/ **18.2-ta'rif.**  $M_n \subset R^m$  bo'lsin. Agar  $\forall \varepsilon > 0$  olinganda ham, shunday  $n_0 \in N$  topilib, barcha  $n > n_0$ ,  $p > n_0$  ( $p \in N$ ) lar uchun  $\rho(M_n, M_{p+n}) < \varepsilon$  tengsizlik bajarilsa,  $\{M_n\}$  ketma-ketlik  $R^m$  fazoda fundamental ketma-ketlik deb ataladi.

Ravshanki, agar  $\{M_n\}$  ( $M_n \subset R^m$ ) ketma-ketlik  $R^m$  fazoda fundamental ketma-ketlik bo'lsa,  $M_n$  ning koordinatalari hosil qilgan  $\{x_1^{(n)}\}, \{x_2^{(n)}\}, \dots, \{x_m^{(n)}\}$  ketma-ketliklarning har biri fundamental ketma-ketlik bo'ladi va aksincha,

$\{x_1^{(n)}\}, \{x_2^{(n)}\}, \dots, \{x_m^{(n)}\}$  ketma-ketliklarning har biri fundamental ketma-ketlik bo'lsa,  $\{M_n\}$  ( $M_n \subset R^m$ ) ketma-ketlik  $R^m$  fazoda fundamental ketma-ketlik bo'ladi, ya'ni quyidagi teorema o'rinli.

**18.2-teorema.**  $R^m$  fazoda  $M_n = M_n(x_1^{(n)}, x_2^{(n)}, \dots, x_m^{(n)})$  ketma-ketlikning fundamental bo'lishi uchun, uning koordinatalaridan hosil bo'lgan  $\{x_1^{(n)}\}, \{x_2^{(n)}\}, \dots, \{x_m^{(n)}\}$  ketma-ketliklarning har biri fundamental ketma-ketlik bo'lishi zarur va yetarli.

**18.3-teorema(Koshi prinsipi).**  $\{M_n\}$  ketma-ketlikning yaqinlashuvchi bo'lishi uchun, uning fundamental ketma-ketlik bo'lishi zarur va yetarli.

**18.4-teorema.** Agar  $\{M_n\}$  ketma-ketlik yaqinlashuvchi bo'lsa, uning limiti yagonadir.

**18.3-ta'rif.** Agar  $\{M_n\}$  ketma-ketlikning barcha hadlaridan tuzilgan to'plam chegaralangan bo'lsa,  $\{M_n\}$  ketma-ketlik chegaralangan ketma-ketlik deb ataladi.

**18.4-ta'rif.** Agar  $\exists R > 0$  mavjud bo'lib,  $\forall n$  lar uchun  $\rho(M_n, O) \leq R$  tengsizlik bajarilsa,  $\{M_n\}$  ketma-ketlik chegaralangan ketma-ketlik deyiladi, bunda  $O(0, 0, \dots, 0)$ .

**18.5-teorema.**  $R^m$  fazoda  $\{M_n\}$  ketma-ketlikning chegaralangan bo'lish uchun, bu ketma-ketlikning koordinatalaridan iborat  $\{x_1^{(n)}\}, \{x_2^{(n)}\}, \dots, \{x_m^{(n)}\}, \dots$  sonlar ketma-ketliklari har birining chegaralangan bo'lishi zarur va yetarlidir.

**18.6-teorema.** Agar  $\{M_n\}$  ketma-ketlik yaqinlashuvchi bo'lsa, u chegaralangan bo'ladi.

**18.7-teorema.** Agar  $\{M_n\}$  ketma-ketlik yaqinlashuvchi bo'lib, uning limiti  $A$  bo'lsa, u holda  $\{kM_n\}$  ( $k \in R$ ) ketma-ketlik ham yaqinlashuvchi bo'lib, uning limiti  $kA$  ga teng bo'ladi, ya'ni  $\lim_{n \rightarrow \infty} kM_n = k \lim_{n \rightarrow \infty} M_n = kA$ .

**18.8-teorema.** Agar  $\{M_n\}$  va  $\{N_n\}$  ketma-ketliklar yaqinlashuvchi bo'lib, ularning limitlari, mos ravishda,  $A$  va  $B$  bo'lsa, u holda  $\{M_n \pm N_n\}$  ketma-ketlik ham yaqinlashuvchi bo'ladi va uning limiti  $A \pm B$  ga teng bo'ladi, ya'ni

$$\lim_{n \rightarrow \infty} (M_n \pm N_n) = \lim_{n \rightarrow \infty} M_n \pm \lim_{n \rightarrow \infty} N_n = A \pm B$$

$R^m$  fazoda  $M_n = M_n(x_1^{(n)}, x_2^{(n)}, \dots, x_m^{(n)})$  ketma-ketlik berilgan bo'lsin. Bu ketma-ketlikning  $n_1, n_2, \dots, n_k, \dots$  ( $n_1 < n_2 < \dots < n_k < \dots, n_k \in N, k = 1, 2, \dots$ ) nomerli hadlaridan tashkil topgan, ushbu  $M_{n_1}, M_{n_2}, \dots, M_{n_k}, \dots$  ( $M_{n_k} \in R^m, k = 1, 2, \dots$ ) ketma-ketlik, berilgan ketma-ketlikning *qismiy ketma-ketligi* deyiladi va u  $\{M_{n_k}\}$  kabi belgilanadi.

Masalan,  $R^2$  fazoda

$$(1;1), \left(\frac{1}{2^2}, \frac{1}{2^2}\right), \left(\frac{1}{3^2}, \frac{1}{3^2}\right), \dots, \left(\frac{1}{n^2}, \frac{1}{n^2}\right), \dots \\ \left(\frac{1}{2}; \frac{1}{2}\right), \left(\frac{1}{4}; \frac{1}{4}\right), \left(\frac{1}{6}; \frac{1}{6}\right), \dots, \left(\frac{1}{2n}; \frac{1}{2n}\right), \dots$$

ketma-ketliklar,  $(1;1), \left(\frac{1}{2}; \frac{1}{2}\right), \left(\frac{1}{3}; \frac{1}{3}\right), \dots, \left(\frac{1}{n}; \frac{1}{n}\right), \dots$  ketma-ketlikning qismiy ketma-ketliklari bo'ladi.

**18.9-teorema.** Agar  $\{M_n\}$  ketma-ketlik yaqinlashuvchi bo'lib, uning limiti  $A$  ( $A \in R^m$ ) bo'lsa, u holda, bu ketma-ketlikning har bir  $\{M_{n_k}\}$  qismiy ketma-ketligi ham yaqinlashuvchi bo'ladi va uning limiti ham  $A$  ga teng bo'ladi.

**18.1-eslatma.** Ketma-ketlik qismiy ketma-ketliklarining limiti mavjud bo'lishidan, berilgan ketma-ketlikning limiti mavjud bo'lishi har doim ham kelib chiqavermaydi. Masalan, ushbu  $(1;1), (-1;-1), (1;1), (-1;-1), \dots, ((-1)^{n+1}; (-1)^{n+1})$  ketma-ketlik limitga ega emas, lekin uning qismiy ketma-ketliklari; mos ravishda,  $(1;1)$  va  $(-1;-1)$  limitlarga ega. Shunday qilib,  $\{M_n\}$  ketma-ketlik limitga ega bo'lmasa ham, uning qismiy ketma-ketliklari limitga ega bo'lishi mumkin ekan.

**18.10-teorema (Bolsano-Veyershtress).** Har qanday chegaralangan ketma-ketlikdan yaqinlashuvchi qismiy ketma-ketlik ajratish mumkin.

**18.3-misol.**  $R^2$  fazoda  $\{M_n\} = \left\{ M_n \left( \frac{2^{n+2} + 3^{n+3}}{2^n + 3^n}, \frac{5 \cdot 2^n - 3 \cdot 5^{n+1}}{100 \cdot 2^n + 2 \cdot 5^n} \right) \right\}$  ketma-ketlikning limitini toping.

**Yechilishi.** Berilgan ketma-ketlikning koordinatalaridan tashkil topgan ketma-ketliklar, sonlar ketma-ketliklari bo'lib, ular quyidagi ko'rinishda bo'ladi:

$$x_1^{(n)} = \frac{2^{n+2} + 3^{n+3}}{2^n + 3^n}, \quad x_2^{(n)} = \frac{5 \cdot 2^n - 3 \cdot 5^{n+1}}{100 \cdot 2^n + 2 \cdot 5^n}.$$

Ravshanki,

$$\lim_{n \rightarrow \infty} x_1^{(n)} = \lim_{n \rightarrow \infty} \frac{2^{n+2} + 3^{n+3}}{2^n + 3^n} = \lim_{n \rightarrow \infty} \frac{4 \cdot (2/3)^n + 27}{(2/3)^n + 1} = 27,$$

$$\lim_{n \rightarrow \infty} x_2^{(n)} = \lim_{n \rightarrow \infty} \frac{5 \cdot (2/5)^n - 15}{100 \cdot (2/5)^n + 2} = -\frac{15}{2}.$$

Demak, 18.1-teoremaga ko'ra, berilgan ketma-ketlikning limiti

$$\lim_{n \rightarrow \infty} M_n = \lim_{n \rightarrow \infty} \left( \frac{2^{n+2} + 3^{n+3}}{2^n + 3^n}, \frac{5 \cdot 2^n - 3 \cdot 5^{n+1}}{100 \cdot 2^n + 2 \cdot 5^n} \right) = A \left( 27; -\frac{15}{2} \right).$$

**18.4-misol.**  $R^4$  fazoda  $\{M_n\} = \left\{ M_n \left( \sqrt{n+1} - \sqrt{n}; \frac{n-1}{n}; \frac{2n^2-1}{n^2}; \left(1 + \frac{2}{n}\right)^n \right) \right\}$

ketma-ketlikning limitini toping.

**Yechilishi.** Berilgan ketma-ketlikning koordinatalaridan tashkil topgan ketma-ketliklar sonlar ketma-ketligi bo'lib, ular

$$x_1^{(n)} = \sqrt{n+1} - \sqrt{n}; x_2^{(n)} = \frac{n-1}{n}; x_3^{(n)} = \frac{2n^2-1}{n^2}; x_4^{(n)} = \left(1 + \frac{2}{n}\right)^n$$

ko'rinishda bo'ladi. Bular uchun

$$\lim_{n \rightarrow \infty} x_1^{(n)} = \lim_{n \rightarrow \infty} (\sqrt{n+1} - \sqrt{n}) = \lim_{n \rightarrow \infty} \frac{1}{\sqrt{n+1} + \sqrt{n}} = 0; \quad \lim_{n \rightarrow \infty} x_2^{(n)} = \lim_{n \rightarrow \infty} \frac{n-1}{n} = 1;$$

$$\lim_{n \rightarrow \infty} x_3^{(n)} = \lim_{n \rightarrow \infty} \frac{2n^2-1}{n^2} = 2; \quad \lim_{n \rightarrow \infty} x_4^{(n)} = \lim_{n \rightarrow \infty} \left(1 + \frac{2}{n}\right)^n = e^2.$$

Demak, 18.1-teoremaga ko'ra, berilgan ketma-ketlikning limiti  $A(0; 1; 2; e^2)$  bo'ladi.

**18.5-misol.**  $R^2$  fazoda  $\{M_n\} = \left\{ M_n \left( \frac{1}{n}; \frac{1}{n} \right) \right\}$  ketma-ketlikning fundamental bo'lishini ko'rsating.

**Yechilishi.** Berilgan  $\forall \varepsilon > 0$  ga ko'ra,  $n_0 = \left[ \frac{2\sqrt{2}}{\varepsilon} \right] + 1$  deb olinsa, u

holda  $\forall n > n_0, \forall p$  ( $p \in N$ ) lar uchun.

$$\begin{aligned} \rho(M_n; M_p) &= \rho \left( M_n \left( \frac{1}{n}, \frac{1}{n} \right); M_p \left( \frac{1}{p}, \frac{1}{p} \right) \right) = \sqrt{\left( \frac{1}{p} - \frac{1}{n} \right)^2 + \left( \frac{1}{p} - \frac{1}{n} \right)^2} = \sqrt{2} \left| \frac{1}{p} - \frac{1}{n} \right| < \\ &< \sqrt{2} \left( \frac{1}{p} + \frac{1}{n} \right) \leq \sqrt{2} \left( \frac{1}{n_0} + \frac{1}{n_0} \right) = 2\sqrt{2} \frac{1}{n_0} < 2\sqrt{2} \frac{1}{2\sqrt{2}} \varepsilon = \varepsilon \end{aligned}$$

tengsizlik o'rini bo'ladi. Demak, 18.2-ta'rifga ko'ra, berilgan ketma-ketlik fundamental bo'lar ekan.

**18.6-misol.**  $R^2$  fazoda  $\{M_n\} = \left\{ M_n \left( 1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n}; 0 \right) \right\}$  ketma-ketlikning fundamental emasligini ko'rsating.

**Yechilishi.**  $\forall n_0$  lar uchun, berilgan  $\exists \varepsilon_0 = \frac{1}{4}$  ga ko'ra,  $n > p$  ( $p \in N$ ), deb olinsa, u holda,

$$\begin{aligned}\rho(M_{n+p}(x_{n+p}, 0), M_n(x_n, 0)) &= \sqrt{(x_{n+p} - x_n)^2} = |x_{n+p} - x_n| = \\ &= \frac{1}{n+1} + \frac{1}{n+2} + \dots + \frac{1}{n+p} > \frac{p}{n+p},\end{aligned}$$

Bundan,  $n = 2p$  bo'lganda,

$$\rho(M_{n+p}(x_{n+p}, 0), M_n(x_n, 0)) > \frac{2}{3} > \frac{1}{4} = \varepsilon_0$$

ekanligi kelib chiqadi. Bu esa, berilgan ketma-ketlikning fundamental emasligini ko'rsatadi.

**18.7- misol.**  $R^2$  fazoda

$$\{M_n\} = \left\{ M_n \left( \frac{\sin 1}{2} + \frac{\sin 2}{4} + \dots + \frac{\sin n}{2^n}; \frac{\cos 1!}{1 \cdot 2} + \frac{\cos 2!}{2 \cdot 3} + \dots + \frac{\cos n!}{n(n+1)} \right) \right\}$$

ketma-ketlikning yaqinlashuvchi ekanligini isbotlang.

**Yechilishi.** Berilgan ketma-ketlikning yaqinlashuvchi ekanligini ko'rsatish uchun, uning fundamental ketma-ketlik ekanligini ko'rsatish etarli. Buning uchun  $\{M_n(x_n, y_n)\}$  ketma-ketlikning koordinatalari hosil qilgan  $\{x_n\}, \{y_n\}$  ketma-ketliklarning har biri fundamental ekanligini ko'rsatamiz. Berilgan  $\forall \varepsilon > 0$  ga ko'ra,  $n_0 = \left[ \log_2 \frac{1}{\varepsilon} \right] + 1$  deb olinsa, u holda,

$\forall n > n_0$  va  $\forall p$  ( $p \in N$ ) lar uchun,

$$\begin{aligned}|x_{n+p} - x_n| &= \left| \frac{\sin(n+1)}{2^{n+1}} + \frac{\sin(n+2)}{2^{n+2}} + \dots + \frac{\sin(n+p)}{2^{n+p}} \right| \leq \frac{1}{2^{n+1}} + \frac{1}{2^{n+2}} + \dots + \frac{1}{2^{n+p}} < \\ &< \frac{1}{2^{n+1}} + \frac{1}{2^{n+2}} + \dots + \frac{1}{2^{n+p}} + \dots = \frac{1}{2^{n+1}} \frac{1}{1 - \frac{1}{2}} = \frac{1}{2^n} < \frac{1}{2^{n_0}} < \varepsilon\end{aligned}$$

tengsizlik o'rinni bo'ladi.

Demak,  $\{x_n\}$  ketma-ketlik fundamental bo'lar ekan.

Endi  $\{y_n\} = \left\{ \frac{\cos 1!}{1 \cdot 2} + \frac{\cos 2!}{2 \cdot 3} + \dots + \frac{\cos n!}{n(n+1)} \right\}$  ketma-ketlikning fundamental

ketma-ketlik ekanligini ko'rsatamiz. Berilgan  $\forall \varepsilon > 0$  ga ko'ra,  $n_0 = \left[ \frac{1}{\varepsilon} \right] + 1$  deb olinsa, u holda  $\forall n > n_0$  va  $\forall p$  ( $p \in N$ ) lar uchun,

$$|y_{n+p} - y_n| = \left| \frac{\cos(n+1)!}{(n+1) \cdot (n+2)} + \frac{\cos(n+2)!}{(n+2) \cdot (n+3)} + \dots + \frac{\cos(n+p)!}{(n+p) \cdot (n+p+1)} \right| \leq$$

$$\leq \frac{1}{(n+1) \cdot (n+2)} + \frac{1}{(n+2) \cdot (n+3)} + \dots + \frac{1}{(n+p) \cdot (n+p+1)} = \\ = \frac{1}{n+1} - \frac{1}{n+2} + \frac{1}{n+2} - \frac{1}{n+3} \dots + \frac{1}{n+p} - \frac{1}{n+p+1} = \frac{1}{n+1} - \frac{1}{n+p+1} < \frac{1}{n+1} < \frac{1}{n_0+1} < \varepsilon$$

tengsizlik o‘rinli bo‘ladi.

Shunday qilib, 18.2- teoremaga ko‘ra, berilgan ketma-ketlik fundamental ketma-ketlik bo‘ladi, bundan esa, 18.4- teoremaga asosan, berilgan ketma-ketlikning yaqinlashuvchi ekanligi kelib chiqadi.

### Mustaqil yechish uchun misollar

$R^2$  fazoda quyidagi ketma-ketlikning limiti  $A (A \in R^2)$  ekanligini isbotlang:

$$18.1. \quad \{M_n\} = \left\{ M_n \left( \frac{1}{n}; \frac{10}{n} \right) \right\}, \quad A = (0; 0).$$

$$18.2. \quad \{M_n\} = \left\{ M_n \left( \frac{4n^2}{n^2-1}; \frac{2-n}{3+n} \right) \right\}, \quad A = (4; -1).$$

$$18.3. \quad \{M_n\} = \left\{ M_n \left( \frac{5}{n}; \frac{2}{n^2} \right) \right\}, \quad A = (0; 0).$$

$$18.4. \quad \{M_n\} = \left\{ M_n \left( \frac{1}{n^2}; \frac{\sin n}{n} \right) \right\}, \quad A = (0; 0).$$

$$18.5. \quad \{M_n\} = \left\{ M_n \left( \frac{n}{5^n}; \frac{3}{n} \right) \right\}, \quad A = (0; 0).$$

$$18.6. \quad \{M_n\} = \left\{ M_n \left( \sqrt[n]{3}; \frac{\log_3 n}{n} \right) \right\}, \quad A = (1; 0).$$

$$18.7. \quad \{M_n\} = \left\{ M_n \left( \sqrt[n]{n}; \frac{n^3}{3^n} \right) \right\}, \quad A = (1; 0).$$

$R^2$  fazoda quyidagi ketma – ketlikning limiti  $A (A \in R^2)$  ekanligini isbotlang:

$$18.9. \quad \{M_n\} = \left\{ M_n \left( \sqrt[3]{9}; \sqrt[2]{0,25} \right) \right\}, \quad A = (1; 1).$$

$$18.10. \quad \{M_n\} = \left\{ M_n \left( \sqrt[4]{2-1}; \sqrt[3]{\frac{n^2+2}{n^2+1}} \right) \right\}, \quad A = (3; 3).$$

$$18.11. \quad \{M_n\} = \left\{ M_n \left( \sqrt[n]{n}; \frac{a^n}{n!} \right) \right\}, \quad (a > 0), \quad A = (1; 0).$$

$$18.12. \quad \{M_n\} = \left\{ M_n \left( \frac{n+1}{n^2-1}; \frac{n^2-3n+4}{n^3+4n^2-5n+6} \right) \right\}, \quad A = (0; 0).$$

$$18.15. \quad \{M_n\} = \left\{ M_n \left( \sqrt[n^2]{n^2}; \sqrt[n]{n} \right) \right\}, \quad A = (1; 1).$$

$$18.16. \quad \{M_n\} = \left\{ M_n \left( \sqrt[3]{3n-2}; \sqrt[n^3+3n]{n^3+3n} \right) \right\}, \quad A = (1; 1).$$

$$18.17. \quad \{M_n\} = \left\{ M_n \left( \frac{\log_2(n^2+1)}{n}; \frac{n - \lg n}{\log_2(4^n+1)} \right) \right\}, \quad A\left(0; \frac{1}{2}\right).$$

$$18.18. \quad \{M_n\} = \left\{ M_n \left( \sqrt{n+2} - \sqrt{n}; \frac{\log_a n}{n} \right) \right\} (a > 1), \quad A(0; 0).$$

$$18.19. \quad \{M_n\} = \left\{ M_n \left( \frac{(-2)^n}{(n+2)^n}; \frac{1}{(0,3)^n \cdot n!} \right) \right\}, \quad A(0; 0).$$

$$18.20. \quad \{M_n\} = \left\{ M_n \left( \frac{1}{2} + \frac{3}{2^2} + \frac{5}{2^3} + \dots + \frac{2n-1}{2^n}; \frac{\sqrt[3]{n^2} \cdot \sin n!}{n+1} \right) \right\}, \quad A(3; 0).$$

$$18.21. \quad \{M_n\} = \left\{ M_n \left( \frac{1^2}{n^3} + \frac{3^2}{n^3} + \dots + \frac{(2n-1)^2}{n^3}; \frac{n}{2^n} \right) \right\}, \quad A\left(\frac{4}{3}; 0\right).$$

## 19-§. Ko‘p o‘zgaruvchili funksiyaning limiti

**19.1. Ko‘p o‘zgaruvchili funksiya limitining ta’riflari.**  $u = f(M)$  funksiya  $\{M\} \subset R^m$  to‘plamda berilgan bo‘lib,  $A(a_1, a_2, \dots, a_m)$  nuqta  $\{M\}$  to‘plamning limit nuqtasi bo‘lsin.

**19.1-ta’rif (Geyne ta’rifi).** Agar  $\{M\}$  to‘plamning nuqtalaridan tuzilgan va  $A$  ga intiluvchi har qanday  $\{M_n\}$  ( $M_n \neq A, n=1,2,\dots$ ) ketma-ketlik olinganda ham, funksiyaning unga mos kelgan  $\{f(M_n)\}$  qiymatlari ketma-ketligi hamma vaqt, yagona  $B$  (chekli yoki cheksiz) limitga intilsa, shu  $B$  ga  $f(M)$  funksiyaning  $A$  nuqtadagi (yoki  $M \rightarrow A$  dagi) limiti deyiladi va u

$$\lim_{M \rightarrow A} f(M) = B \text{ yoki } \lim_{\substack{x_1 \rightarrow a_1 \\ x_2 \rightarrow a_2 \\ \vdots \\ x_m \rightarrow a_m}} f(x_1, x_2, \dots, x_m) = B \text{ yoki } M \rightarrow A \text{ da } f(M) \rightarrow B$$

kabi belgilanadi.

**19.2.-ta’rif (Koshi ta’rifi).** Agar  $\forall \varepsilon > 0$  son uchun,  $\exists \delta > 0$  bo‘lib,  $0 < \rho(M; A) < \delta$  tengsizliklarni qanoatlantiruvchi barcha  $M \in \{M\}$  nuqtalarda

$$|f(M) - B| < \varepsilon$$

tengsizlik bajarilsa, shu  $B$  songa  $f(x)$  funksiyaning  $A$  nuqtadagi ( $M \rightarrow A$  dagi) limiti deyiladi.

$u = f(M)$  funksiya  $\{M\} \subset R^m$  to‘plamda aniklangan bo‘lib,  $\infty$  esa,  $\{M\}$  to‘plamning limit nuqtasi bo‘lsin.

**19.3-ta’rif (Geyne ta’rifi).** Agar  $\{M\}$  to‘plamning nuqtalaridan tuzilgan har qanday  $\{M_n\}$  ketma-ketlik uchun  $M \rightarrow \infty$  da funksiyaning unga mos kelgan  $\{f(M_n)\}$  qiymatlari ketma-ketligi hamma vaqt yagona  $B$

songa intilsa, shu  $B$  songa  $f(M)$  funksiyaning  $M \rightarrow \infty$  dagi limiti deyiladi va  $\lim_{M \rightarrow \infty} f(M) = B$  kabi belgilanadi.

**19.4-ta'rif.** Agar  $\forall \varepsilon > 0$  son uchun, shunday  $\exists E > 0$  bo'lib,  $\rho(M, O) > E$  tengsizlikni qanoatlantiruvchi barcha  $M \in \{M\}$  nuqtalarda  $|f(M) - B| < \varepsilon$  tengsizlik bajarilsa,  $B$  son  $f(M)$  funksiyaning  $M \rightarrow \infty$  dagi limiti deyiladi va  $\lim_{M \rightarrow \infty} f(M) = B$  yoki  $\lim_{\substack{x_1 \rightarrow \infty \\ x_2 \rightarrow \infty \\ \dots \\ x_n \rightarrow \infty}} f(x_1, x_2, \dots, x_n) = B$  kabi belgilanadi.

**19.5-ta'rif (Koshi ta'rifi).** Agar  $\forall \varepsilon > 0$  son uchun  $\exists \delta > 0$  bo'lib,  $0 < \rho(M, A) < \delta$  tengsizlikni qanoatlantiruvchi barcha  $M \in \{M\}$  nuqtalarda  $|f(M)| > \varepsilon$  ( $f(M) > \varepsilon; f(M) < -\varepsilon$ ) bo'lsa,  $f(M)$  funksiyaning  $A$  nuqtadagi ( $M \rightarrow A$  dagi) limiti  $+\infty$  ( $-\infty$ ) deyiladi.

**19.1- misol.** Ushbu

$$f(x, y) = \begin{cases} \frac{x, y}{\sqrt{x^2 + y^2}}, & x^2 + y^2 > 0 \text{ bo'lganda,} \\ 0, & x^2 + y^2 = 0 \text{ bo'lganda,} \end{cases}$$

funksiyaning  $M(x, y) \rightarrow A(0; 0)$  ( $x \rightarrow 0, y \rightarrow 0$ ) dagi limiti nolga teng ekanligini ko'rsating.

Yechilishi.  $f(x, y)$  funksiya  $R^2$  da berilgan bo'lib,  $A(0; 0)$  nuqta shu to'plamning limit nuqtasidan iborat.

1) *Geyne ta'rifi buyicha:*  $R^2$  to'plamdan  $A(0; 0)$  nuqtaga intiluvchi ixtiyoriy  $\{M_n\} = \{M_n(x^{(n)}, y^{(n)})\}$  ( $M_n \neq A(0; 0), n = 1, 2, \dots$ ) ketma-ketlikni olamiz. Funksiyaning unga mos kelgan  $\{f(M_n)\}$  qiymatlari ketma-ketligi uchun,

$$f(M_n) = f(x^{(n)}, y^{(n)}) = \frac{x^{(n)} \cdot y^{(n)}}{\sqrt{(x^{(n)})^2 + (y^{(n)})^2}} = \sqrt{\frac{x^{(n)} \cdot y^{(n)}}{(x^{(n)})^2 + (y^{(n)})^2}} \cdot \sqrt{x^{(n)} \cdot y^{(n)}} \leq \frac{1}{\sqrt{2}} \sqrt{x^{(n)} \cdot y^{(n)}}$$

bo'ladi. Bundan  $x^{(n)} \rightarrow 0, y^{(n)} \rightarrow 0$  da  $\sqrt{x^{(n)} \cdot y^{(n)}} \rightarrow 0$ .

$$\text{Demak, } \lim_{M \rightarrow A} f(M) = \lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{xy}{\sqrt{x^2 + y^2}} = 0.$$

2) *Koshi ta'rifi bo'yicha:*  $\forall \varepsilon > 0$  songa ko'ra,  $\delta = 2\varepsilon$  deyilsa, u holda,  $0 < \rho(M; A(0, 0)) < \delta$  tengsizliklarni qanoatlantiruvchi barcha  $M(x, y)$  nuqtalarda

$$|f(x, y) - 0| = \left| \frac{xy}{\sqrt{x^2 + y^2}} \right| \leq \frac{1}{2} \sqrt{x^2 + y^2} = \frac{1}{2} \rho(M, A) < \frac{1}{2} \delta = \varepsilon$$

tengsizlik o'rinali bo'ladi.

**19.2-misol.** Ushbu  $f(x,y) = \frac{2xy}{x^2 + y^2}$  funksiyaning  $M(x,y) \rightarrow A(0,0)$

( $x \rightarrow 0, y \rightarrow 0$ ) dagi limiti mavjud emasligini ko'rsating.

**Yechilishi.** Bu funksiya  $R^2 \setminus \{(0,0)\}$  to'plamda aniqlangan bo'lib,  $A(0,0)$  nuqta shu to'plamning limit nuqtasidir. Ravshanki,

$$M_n(x^{(n)}, y^{(n)}) = M_n\left(\frac{1}{n}; \frac{1}{n}\right), \quad \overline{M}_n(x^{(n)}, y^{(n)}) = \overline{M}_n\left(\frac{1}{n}; \frac{1}{n^2}\right)$$

ketma-ketliklar  $n \rightarrow \infty$  da  $M_n \rightarrow A(0,0)$ ,  $\overline{M}_n \rightarrow A(0,0)$ . Funksiyaning bu ketma-ketliklarga mos kelgan  $\{f(x^{(n)}, y^{(n)})\}$ ,  $\{\overline{f}(x^{(n)}, y^{(n)})\}$  qiymatlari ketma-ketligi uchun, mos ravishda,

$$f(x^{(n)}, y^{(n)}) = \frac{\frac{2}{n} \cdot \frac{1}{n^2}}{\frac{1}{n^2} + \frac{1}{n^2}} \xrightarrow{n \rightarrow \infty} 1, \quad \overline{f}(x^{(n)}, y^{(n)}) = \frac{\frac{2}{n^3}}{\frac{1}{n^2} + \frac{1}{n^4}} \rightarrow 0$$

bo'ldi. Bu esa,  $M(x,y) \rightarrow A(0,0)$  da berilgan funksiyaning limiti mavjud emasligini anglatadi.

**19.3-misol.** Ushbu  $\lim_{\substack{x \rightarrow \infty \\ y \rightarrow \infty}} \frac{x+y}{x^2 - xy + y^2}$  limitni hisoblang.

**Yechilishi.** Ravshanki,  $x^2 + xy + y^2 \geq xy$  tengsizlik doimo o'rinali. Bundan,  $x \neq 0, y \neq 0$  bo'lganda,

$$0 \leq \left| \frac{x+y}{x^2 - xy + y^2} \right| \leq \left| \frac{x+y}{xy} \right| \leq \frac{1}{|y|} + \frac{1}{|x|}$$

tengsizlikni olamiz. Bu yerdan,

$$0 \leq \lim_{\substack{x \rightarrow \infty \\ y \rightarrow \infty}} \left| \frac{x+y}{x^2 - xy + y^2} \right| \leq \lim_{\substack{x \rightarrow \infty \\ y \rightarrow \infty}} \left( \frac{1}{|y|} + \frac{1}{|x|} \right) = 0.$$

Shunday qilib,  $\lim_{\substack{x \rightarrow \infty \\ y \rightarrow \infty}} \frac{x+y}{x^2 - xy + y^2} = 0$ .

**19.4-misol.** Ushbu  $f(x,y) = \frac{x^4 + y^2}{x^2 + y^4}$  funksiya  $x \rightarrow \infty, y \rightarrow \infty$  da limitga ega bo'lmashagini isbotlang.

**Yechilishi.**  $x = t, y = t^4$  deb olinsa,  $t \rightarrow \infty$  da  $x \rightarrow \infty, y \rightarrow \infty$  va

$$\lim_{t \rightarrow \infty} f(t, t^4) = \lim_{t \rightarrow \infty} \frac{t^4 + t^8}{t^2 + t^{16}} = 0.$$

Ikkinchi tomondan  $x = t^2, y = t$  deyilsa,  $\lim_{t \rightarrow \infty} f(t^2, t) = \lim_{t \rightarrow \infty} \frac{t^8 + t^2}{t^4 + t^4} = \infty$ .

Demak,  $\lim_{\substack{x \rightarrow \infty \\ y \rightarrow \infty}} \frac{x^4 + y^2}{x^2 + y^4}$  - mavjud emas.

**19.5-misol.** Ushbu  $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 3}} f(x, y)$ , bunda

$$f(x, y) = \begin{cases} \frac{\sin(x^2 y)}{x^2}, & x \neq 0 \text{ bo'lganda,} \\ 3, & x = 0 \text{ bo'lganda,} \end{cases}$$

limitni hisoblang.

**Yechilishi.**  $x=0, y=3$  bo'lsa, berilgan kasrning surati ham, maxraji ham nolga aylanadi. Shuning uchun,  $x^2 y = \alpha$  deb olinsa, u holda,  $x \rightarrow 0$  va  $y=3$  bo'lganda  $\alpha \rightarrow 0$  va

$$\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 3}} \frac{\sin(x^2 y)}{x^2} = \lim_{\substack{x \rightarrow 0 \\ y \rightarrow 3}} \frac{\sin(x^2 y)}{x^2 \cdot y} \cdot y = \lim_{\substack{x \rightarrow 0 \\ y \rightarrow 3}} \frac{\sin \alpha}{\alpha} \cdot y = 1 \cdot 3 = 3.$$

Agar  $x=0$  bo'lsa,  $f(x, y)=3$  va  $\lim_{y \rightarrow 3} f(x, y)=3$ .

**19.5, a-misol.** Ushbu

$$a) \lim_{\substack{x \rightarrow +\infty \\ y \rightarrow +\infty}} \left( \frac{xy}{x^2 + y^2} \right)^{x^2}; \quad b) \lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} (x^2 + y^2)^{x^2 y^2}$$

limitlarni hisoblang

**Yechilishi.** a) Ravshanki,  $x^2 + y^2 \geq 2xy$  tengsizlik o'rini. Bundan  $\frac{xy}{x^2 + y^2} \leq \frac{1}{2}$  o'rinnlidir. Bularni e'tiborga olgan holda,

$$0 < \left( \frac{xy}{x^2 + y^2} \right)^{x^2} \leq \left( \frac{1}{2} \right)^{x^2} \xrightarrow[x \rightarrow \infty]{} 0$$

ekanligini olamiz.

Demak, bu tengsizlikdan,  $\lim_{\substack{x \rightarrow +\infty \\ y \rightarrow +\infty}} \left( \frac{xy}{x^2 + y^2} \right)^{x^2} = 0$  ekanligi kelib chikadi.

b)  $0 < x^2 + y^2 < 1$  bo'lganda,

$$x^2 y^2 \leq \frac{1}{4} (x^2 + y^2)^2, 1 \geq (x^2 + y^2)^{x^2 y^2} \geq (x^2 + y^2)^{\frac{1}{4}(x^2 + y^2)^2}$$

tengsizliklar o'rini. Bu tengsizliklarni e'tiborga olib,

$$\lim_{x \rightarrow 0} (x^2 + y^2)^{\frac{1}{4}(x^2 + y^2)^2} = \lim_{t \rightarrow 0+0} t^{\frac{1}{4}t^2} = \lim_{t \rightarrow 0+0} e^{\frac{1}{4}t^2 \ln t} = 1$$

ekanligini topamiz.

Demak, (\*) tengsizlikka asosan,  $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} (x^2 + y^2)^{x^2 y^2} = 1$  ekanligi kelib

chiqadi.

$u = f(M)$  funksiya  $\{M\} \subset R^n$  to'plamda berilgan bo'lib,  $A(a_1, a_2, \dots, a_m)$  nuqta  $\{M\}$  to'plamning limit nuqtasi bo'lsin.

**19.2. Cheksiz kichik va cheksiz katta funksiyalar.**  $\alpha(M)$  funksiya  $\{M\} \subset R^m$  to‘plamda aniqlangan bo‘lib,  $A(a_1, a_2, \dots, a_m)$  nuqta  $\{M\}$  to‘plamning limit nuqtasi bo‘lsin.

**19.6-ta’rif.** Agar  $M \rightarrow A$  da  $\alpha(M)$  funksiyaning limiti nol, ya’ni  $\lim_{M \rightarrow A} \alpha(M) = 0$  bo‘lsa, u holda,  $\alpha(M)$  funksiya,  $M \rightarrow A$  da cheksiz kichik funksiya deyiladi.

**19.1-eslatma.** Berilgan  $f(M)$  funksiya  $M \rightarrow A$  da  $B$  limitga ega bo‘lishi uchun,  $\alpha(M) = f(M) - B$  ning cheksiz kichik funksiya bo‘lishi zarur va yetarli.

Demak,  $M \rightarrow A$  da  $f(M)$  funksiya  $B$  limitga ega bo‘lsa, bu funksiyani, har doim,

$$f(M) = B + \alpha(M) \quad (19.1)$$

ko‘rinishda ifodalash mumkin, bunda  $\alpha(M)$  cheksiz kichik funksiya.

*Cheksiz kichik funksiyalar quyidagi xossalarga ega:*

**1- xossa.** Agar  $M \rightarrow A$  da  $\alpha(M)$  va  $\beta(M)$  cheksiz kichik funksiyalar bo‘lsa, u holda,  $\alpha(M) \pm \beta(M)$  ham cheksiz kichik funksiya bo‘ladi.

**2- xossa.** Agar  $M \rightarrow A$  da  $\alpha(M)$ - cheksiz kichik funksiya,  $\beta(M)$  funksiya esa, chegaralangan bo‘lsa, u holda,  $\alpha(M) \cdot \beta(M)$  (ularning ko‘paytmasi) ham cheksiz kichik bo‘ladi.

**19.7-ta’rif.** Agar  $\{M\} \subset R^m$  to‘plamda aniqlangan  $F(M)$  funksiya uchun  $\lim_{M \rightarrow A} F(M) = \infty$  bo‘lsa,  $F(M)$  funksiya  $M \rightarrow A$  da cheksiz katta funksiya deyiladi.

**3- xossa.** Agar  $M \rightarrow A$  da  $\alpha(M)$  cheksiz kichik ( $\alpha(M) \neq 0$ ) funksiya bo‘lsa, u holda  $\frac{1}{\alpha(M)}$  -  $M \rightarrow A$  da cheksiz katta funksiya bo‘ladi.

**4- xossa.** Agar  $M \rightarrow A$  da  $F(M)$  cheksiz katta funksiya bo‘lsa,  $\frac{1}{F(M)}$  funksiya  $M \rightarrow A$  da cheksiz kichik funksiya bo‘ladi.

**19.3. Limitga ega bo‘lgan funksiyalarning xossalari.**  $\{M\} \subset R^m$  to‘plamda  $f(M)$  funksiya aniqlangan bo‘lib,  $A(A \in R^m)$  nuqta  $\{M\}$  to‘plamning limit nuqtasi bo‘lsin

**1- xossa.** Agar  $\lim_{M \rightarrow A} f(M) = B$  mavjud bo‘lib,  $B > p (B < q)$  bo‘lsa, u holda  $A$  nuqtaning etarli kichik atrofidagi  $M \in \{M\}$  ( $M \neq A$ ) nuqtalarda  $f(M) > p$  ( $f(M) < q$ ) bo‘ladi.

Xususan,  $B \neq 0$  bo‘lsa, u holda,  $A$  nuqtaning yetarli kichik atrofida  $f(M) \neq 0$  bo‘ladi.

**2- xossa.** Agar  $\lim_{M \rightarrow A} f(M) = B$  mavjud bo'lsa,  $A$  nuqtaning yetarli kichik atrofidagi  $M \in \{M\} (M \neq A)$  nuqtalarda  $f(M)$  funksiya chegaralangan bo'ladi.

$\{M\} \subset R^m$  to'plamda  $f(M)$  va  $g(M)$  funksiyalar berilgan bo'lsin.

**3- xossa.** Agar  $f(M)$  va  $g(M)$  funksiyalar,  $M \rightarrow A$  da, mos ravishda,  $B$  va  $C$  limitlarga ega bo'lsa, u holda  $f(M) \pm g(M)$ ,  $f(M) \cdot g(M)$  va  $\frac{f(M)}{g(M)}$  ( $C \neq 0$ ) funksiyalar ham, mos ravishda,  $B \pm C$ ,  $B \cdot C$ ,  $\frac{B}{C}$  limitlarga ega bo'ladi.

**19.2- eslatma.**  $f(M)$  va  $g(M)$  funksiyalarning yig'indisi, ko'paytmasi va nisbati limitga ega bo'lishidan, bu funksiyalardan har birining limitga ega bo'lishi har doim ham kelib chiqavermaydi.

**19.3- eslatma.** Agar:

1)  $\lim_{M \rightarrow A} f(M) = 0$ ,  $\lim_{M \rightarrow A} g(M) = 0$  bo'lsa,  $\frac{f(M)}{g(M)}$  ifoda;

2)  $\lim_{M \rightarrow A} f(M) = \infty$ ,  $\lim_{M \rightarrow A} g(M) = \infty$  bo'lsa,  $\frac{f(M)}{g(M)}$  ifoda;

3)  $\lim_{M \rightarrow A} f(M) = 0$ ,  $\lim_{M \rightarrow A} g(M) = \infty$  bo'lsa,  $f(M) \cdot g(M)$  ifoda;

4)  $f(M)$  va  $g(M)$  funksiyalar  $M \rightarrow A$  da turli xil ishorali cheksiz limitga ega bo'lsa,  $f(M) + g(M)$  ifoda; mos ravishda,  $\frac{0}{0}, \frac{\infty}{\infty}, 0 \cdot \infty, \infty - \infty$  ko'rinishidagi aniqmasliklarni ifodalaydi.

**19.4- eslatma.** Agar:

1)  $\lim_{M \rightarrow A} f(M) = 0$ ,  $\lim_{M \rightarrow A} g(M) = 0$  bo'lsa;

2)  $\lim_{M \rightarrow A} f(M) = 1$ ,  $\lim_{M \rightarrow \infty} g(M) = \infty$  bo'lsa;

3)  $\lim_{M \rightarrow A} f(M) = \infty$ ,  $\lim_{M \rightarrow A} g(M) = 0$  bo'lsa,

u holda,  $[f(M)]^{g(M)}$  – ifoda, mos ravishda,  $0^0, 1^\infty, \infty^0$  ko'rinishdagi aniqmasliklarni ifodalaydi.

**19.1-teorema (Koshi kriteriysi).**  $u = f(M)$  funksiyaning chekli limitga ega bo'lishi uchun,  $\forall \varepsilon > 0$  son olinganda ham, shunday  $\delta > 0$  bo'lib,  $0 < \rho(M', A) < \delta$ ,  $0 < \rho(M'', A) < \delta$  tengsizliklarni qanoatlantiruvchi barcha  $M', M'' \in \{M\}$  nuqtalarda  $|f(M') - f(M'')| < \varepsilon$  tengsizlikning bajarilishi zarur va yetarli.

**19.4. Takroriy limitlar.** Biz yuqorida  $u = f(M) = f(x_1, x_2, \dots, x_m)$  funksiyaning  $A = A(a_1, a_2, \dots, a_m)$  nuqtadagi limiti  $\lim_{M \rightarrow A} f(M) = B$  yoki  $\lim_{\substack{x_1 \rightarrow a_1 \\ x_2 \rightarrow a_2 \\ \vdots \\ x_m \rightarrow a_m}} f(x_1, x_2, \dots, x_m) = B$  bilan tanishdik.

Demak, funksiyaning limiti, uning argumentlarining  $x_1, x_2, \dots, x_m$  bir yo‘la, mos ravishda,  $a_1, a_2, \dots, a_m$  sonlarga intilgandagi limitidan iborat ekan. Biz bundan buyon, bu limitni, *karrali limit* deb ataymiz.

Ko‘p o‘zgaruvchili funksiyalargagina xos bo‘lgan, boshqa ko‘rinishdagi, limit tushunchasini kiritamiz.  $u = f(M) = f(x_1, x_2, \dots, x_m)$  funksiya  $\{M\} \subset R^m$  to‘plamda berilgan bo‘lib,  $A = A(a_1, a_2, \dots, a_m)$  nuqta- $\{M\}$  to‘plamning limit nuqtasi bo‘lsin. Berilgan funksiyaning  $x_1 \rightarrow a_1$  (qolgan barcha argumentlarini tayinlab) dagi limiti  $\lim_{x_1 \rightarrow a_1} f(x_1, x_2, \dots, x_m)$  ni qaraylik, bu limit  $x_2, x_3, \dots, x_m$  o‘zgaruvchilarga bog‘liq bo‘ladi:

$$\lim_{x_1 \rightarrow a_1} f(x_1, x_2, \dots, x_m) = \varphi_1(x_2, x_3, \dots, x_m).$$

Endi,  $\varphi_1(x_2, \dots, x_m)$  funksiyaning  $x_2 \rightarrow a_2$  (qolgan barcha argumentlarni tayinlab) dagi limitini qaraymiz, bu  $\lim_{x_2 \rightarrow a_2} \varphi_1(x_2, x_3, \dots, x_m)$  limit  $x_3, x_4, \dots, x_m$  o‘zgaruvchilarga bog‘lik bo‘ladi:  $\lim_{x_2 \rightarrow a_2} \varphi_1(x_2, x_3, \dots, x_m) = \varphi_2(x_3, x_4, \dots, x_m)$ .

Xuddi shunday, birin ketin,  $x_3 \rightarrow a_3, x_4 \rightarrow a_4, \dots, x_m \rightarrow a_m$  da limitga o‘tib,  $\lim_{x_m \rightarrow a_m} \lim_{x_{m-1} \rightarrow a_{m-1}} \dots \lim_{x_3 \rightarrow a_3} f(x_1, x_2, \dots, x_m)$  ni hosil qilamiz. Bu limitga  $f(x_1, x_2, \dots, x_m)$  funksiyaning *takroriy limiti* deyiladi.

Xuddi shunday,  $f(x_1, x_2, \dots, x_m)$  funksiyaning  $x_{i_1}, x_{i_2}, \dots, x_{i_k}$  argumentlari, mos ravishda,  $a_{i_1}, a_{i_2}, \dots, a_{i_k}$  larga intilgandagi  $\lim_{x_{i_k} \rightarrow a_{i_k}} \dots \lim_{x_{i_1} \rightarrow a_{i_1}} f(x_1, x_2, \dots, x_m)$  takroriy limitni ham qarash mumkin.

Ravshanki,  $f(x_1, x_2, \dots, x_m)$  funksiyaning  $x_1, x_2, \dots, x_m$  argumentlari, mos ravishda,  $a_{i_1}, a_{i_2}, \dots, a_{i_k}$  sonlarga, turli tartibda intilganda, funksiyaning turli takroriy limitlari hosil bo‘ladi.

**19.6-misol.**  $f(x, y) = (x+y)\sin \frac{1}{x} \sin \frac{1}{y}$  funksiyaning  $M(x, y) \rightarrow O(0;0)$  da cheksiz kichik funksiya ekanligini isbotlang.

**Yechilishi.** Cheksiz kichik funksiyaning ta’rifiga ko‘ra,  $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} f(x, y) = 0$  tenglikning o‘rinli ekanligini ko‘rsatish yetarli. Ravshanki, berilgan  $f(x, y)$  funksiya koordinatalar o‘qlarida aniqlanmagan, lekin  $O(0,0)$  nuqta funksiya aniqlanish sohasining limit nuqtasidan iborat. Shuning uchun,

berilgan funksiyaning  $O(0;0)$  nuqtadagi limitini qarash mumkin. Bu limitni, limitning Koshi ta'rifi bo'yicha qaraymiz.  $\forall \varepsilon > 0$  songa ko'ra,  $\delta = \varepsilon/2$  deb olinsa, u holda,  $\rho(M(x,y), O(0;0)) = \sqrt{x^2 + y^2} < \delta$  dan  $|x| < \delta$  va  $|y| < \delta$  bo'lishi kelib chiqadi. Demak,

$$|f(x,y) - 0| = \left| (x+y) \sin \frac{1}{x} \sin \frac{1}{y} \right| \leq |x| + |y| < 2\delta = \varepsilon.$$

Bundan, ta'rifga ko'ra,

$$\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} f(x,y) = \lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} (x+y) \sin \frac{1}{x} \sin \frac{1}{y} = 0$$

ekanligi kelib chiqadi.

Shunday qilib, berilgan funksiyaning  $M \rightarrow 0$  da cheksiz kichik funksiya ekanligi isbotlanadi.

**19.7- misol.** Ushbu  $f(x,y) = (x+y) \sin \frac{1}{x} \cdot \sin \frac{1}{y}$  funksiyaning  $O(0;0)$

nuqtada takroriy limitlari mavjudmi?

**Yechilishi.**  $\lim_{y \rightarrow 0} \lim_{x \rightarrow 0} f(x,y) =$  takroriy limitning  $\lim_{\substack{x \rightarrow 0 \\ y \neq 0, \text{ берилган}}} f(x,y) -$  ichki

limitini qaraymiz. Avvalo, berilgan  $f(x,y)$  funksiyani quyidagicha tasvirlaymiz:  $f(x,y) = x \sin \frac{1}{x} \cdot \sin \frac{1}{y} + y \sin \frac{1}{x} \cdot \sin \frac{1}{y}$ . Bunda, belgilangan  $y \neq 0$  uchun, birinchi qo'shiluvchining  $x \rightarrow 0$  dagi limiti, ya'ni  $\lim_{x \rightarrow 0} x \cdot \sin \frac{1}{x} \cdot \sin \frac{1}{y} = 0$ ; ikkinchi qo'shiluvchidagi  $y \cdot \sin \frac{1}{x} \cdot \sin \frac{1}{y}$  ko'paytuvchi,  $y \neq \frac{1}{n\pi} (n \in \mathbb{Z})$  bo'lganda, noldan farqli o'zgarmas son,  $\sin \frac{1}{x}$  ko'paytuvchi esa,  $x \rightarrow 0$  da limitga ega emas, demak, ikkinchi qo'shiluvchi limitga ega bo'lmaydi. U holda,  $f(x,y) = x \sin \frac{1}{x} \cdot \sin \frac{1}{y} + y \sin \frac{1}{x} \cdot \sin \frac{1}{y}$  funksiya, belgilangan  $y$  ( $y \neq 0, y \neq n\pi$ ) uchun,  $x \rightarrow 0$  da limitga ega bo'lmaydi. Shunday qilib, ichki limit mavjud emas, shunga ko'ra,  $\lim_{y \rightarrow 0} \lim_{x \rightarrow 0} f(x,y)$  takroriy limitning mavjud emasligi kelib chiqadi. Xuddi shunday,  $\lim_{y \rightarrow 0} \lim_{x \rightarrow 0} f(x,y)$  takroriy limitning ham mavjud emasligini ko'rsatish mumkin.

**19.5- eslatma.** 19.6- misolda  $f(x,y) = (x+y) \sin \frac{1}{x} \cdot \sin \frac{1}{y}$  funksiyaning

$O(0,0)$  nuqtadagi karrali limiti mavjud va uning nolga teng ekanligi isbotlangan edi. 19.7-misolda esa, uning takroriy limitlarining mavjud emasligi ko'rsatildi. Demak, funksiyaning nuqtada karrali limiti har doim mavjudligidan, uning shu nuqtada takroriy limitlari mavjudligi kelib chiqmasligi to'g'risida xulosa chiqarish mumkin ekan.

**19.8- misol.**  $f(x, y) = \frac{2xy}{x^2 + y^2}$  funksiyaning  $O(0;0)$  nuqtadagi takroriy limitlarini hisoblang.

**Yechilishi.** Takroriy limitlarni topamiz:

$$\lim_{x \rightarrow 0} \lim_{y \rightarrow 0} f(x, y) = \lim_{x \rightarrow 0} \left( \lim_{\substack{y \rightarrow 0 \\ y \neq 0}} \frac{2xy}{x^2 + y^2} \right) = \lim_{x \rightarrow 0} \left( \frac{0}{x^2} \right) = 0.$$

Xuddi shunday,  $\lim_{y \rightarrow 0} \lim_{x \rightarrow 0} f(x, y) = 0$  ekanligini ko'rsatish mumkin.

**19.6-eslatma.** 19.2- misolda  $f(x, y) = \frac{2xy}{x^2 + y^2}$  funksiyaning  $O(0;0)$

nuqtada karrali limiti mavjud emasligi ko'rsatilgan edi. Demak, 19.2 va 19.8 misollarga asosan, berilgan nuqtada takroriy limitlarning mavjudligi va ularning tengligidan, bu nuqtada funksiyaning karrali limiti mavjudligi har doim kelib chiqavermas ekan, degan xulosa chiqarish mumkin.

**19.6- misol.** Ushbu

$$f(x, y) = \begin{cases} \frac{x - y + x^2 + y^2}{x + y}, & y \neq -x \text{ bo'lganda,} \\ 0, & y = -x \text{ bo'lganda,} \end{cases}$$

funksiyaning  $x \rightarrow 0, y \rightarrow 0$  dagi takroriy limitlarini hisoblang.

**Yechilishi.**  $y$  belgilangan va  $y \neq 0$  bo'lsin. U holda,

$$\lim_{x \rightarrow 0} f(x, y) = \lim_{x \rightarrow 0} \frac{x - y + x^2 + y^2}{x + y} = \frac{-y + y^2}{y} = -1 + y,$$

bundan,  $\lim_{y \rightarrow 0} [\lim_{x \rightarrow 0} f(x, y)] = \lim_{y \rightarrow 0} (-1 + y) = -1$  bo'lishi kelib chiqadi. Endi  $x$  belgilangan va  $x \neq 0$  bo'lsin. U holda,

$$\lim_{y \rightarrow 0} f(x, y) = \lim_{y \rightarrow 0} \frac{x - y + x^2 + y^2}{x + y} = \frac{x + x^2}{x} = 1 + x,$$

bundan  $\lim_{x \rightarrow 0} [\lim_{y \rightarrow 0} f(x, y)] = \lim_{x \rightarrow 0} (1 + x) = 1$  bo'lishi kelib chiqadi.

Shunday qilib, berilgan funksiyaning takroriy limitlari mavjud, lekin ular o'zaro teng emas, ya'ni  $\lim_{x \rightarrow 0} [\lim_{y \rightarrow 0} f(x, y)] \neq \lim_{y \rightarrow 0} [\lim_{x \rightarrow 0} f(x, y)]$ .

**19.7-eslatma.** 19.6- misoldan ko'rindaniki, funksiyaning karrali va takroriy limitlarining teng bo'lishi uchun, ma'lum shartlarning bajarilishi kerak bo'lar ekan.

**19.2-teorema.**  $u = f(M)$  funksiya  $\{M\} = \{(x, y) \in R^2 : |x - x^0| < d_1, |y - y^0| < d_2\}$  to'plamda berilgan bo'lib,  $y$  quyidagi shartlarni qanoatlantirsin:

1)  $(x, y) \rightarrow (x^0, y^0)$  da  $f(x, y)$  funksiyaning  $\lim_{\substack{x \rightarrow x^0 \\ y \rightarrow y^0}} f(x, y) = B$  karrali limiti mavjud;

2) har bir tayinlangan  $x$  da  $\lim_{y \rightarrow y^0} f(x, y) = \phi(x)$  mavjud, har bir tayinlangan  $y$  da  $\lim_{x \rightarrow x^0} f(x, y) = \phi(y)$  mavjud bo'lsin. U holda  $\lim_{x \rightarrow x^0} \lim_{y \rightarrow y^0} f(x, y)$  va  $\lim_{y \rightarrow y^0} \lim_{x \rightarrow x^0} f(x, y)$  takroriy limitlar ham mavjud va ular  $B$  ga teng bo'ladi.

**Natiya.** 19.2- teoremaning shartlari bajarilganda,

$$\lim_{\substack{x \rightarrow x^0 \\ y \rightarrow y^0}} f(x, y) = \lim_{x \rightarrow x^0} \lim_{y \rightarrow y^0} f(x, y) = \lim_{y \rightarrow y^0} \lim_{x \rightarrow x^0} f(x, y)$$

munosabat o'rini.

### Mustaqil yechish uchun misollar

Quyidagi limitlarni hisoblang:

19.1.  $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow \ln 2}} e^y \cos x.$

19.2.  $\lim_{\substack{x \rightarrow 1 \\ y \rightarrow 1}} \frac{x - y}{x^2 - y^2}.$

19.3.  $\lim_{\substack{x \rightarrow 1 \\ y \rightarrow -1 \\ z \rightarrow e}} \ln|x + y + z|.$

19.4.  $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow \pi x}} \frac{\sin xy}{x}.$

19.5.  $\lim_{\substack{x \rightarrow 1 \\ y \rightarrow 0}} \frac{tg 2xy}{x^2 y}.$

19.6.  $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 3}} (1 + xy^2)^{\frac{y}{x^2 y + y^3}}.$

19.7.  $\lim_{\substack{x \rightarrow \infty \\ y \rightarrow \infty}} \frac{ax + by}{x^2 + xy + y^2}.$

19.8.  $\lim_{\substack{x \rightarrow \infty \\ y \rightarrow \infty}} \frac{x^2 + y^2}{x^a + y^4}.$

19.9.  $\lim_{\substack{x \rightarrow \infty \\ y \rightarrow \infty}} \frac{x^2 + y^2}{\left| x^3 \right| + \left| y^3 \right|}.$

19.10.  $\lim_{\substack{x \rightarrow \infty \\ y \rightarrow \infty}} (x + y)^{-\frac{1}{(x^2 + y^2)}}.$

19.11.  $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} (x^2 + y^2)^{\frac{1}{|x|}}.$

19.12. Ushbu  $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 1}} f(x, y)$  ni hisoblang, bunda

$$f(x, y) = \begin{cases} \frac{x^2 y}{\sqrt{1 + x^2 y} - 1}, & x^2 y \neq 0 \text{ bo'lganda,} \\ 2, & x^2 y = 0 \text{ bo'lganda.} \end{cases}$$

Quyidagi karrali limitlarni hisoblang:

19.13.  $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{\sqrt{1 + x^2 y^2} - 1}{x^2 + y^2}.$

19.14.  $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{\sin(x^4 y^2)}{(x^2 + y^2)^2}.$

19.15.  $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{(x^2 + y^2)}{1 - \cos(x^2 + y^2)}.$

19.16.  $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{e^{\frac{1}{x^4 + y^4}} - 1}{x^4 + y^4}.$

**19.17.**  $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} (1 + x^2 y^2)^{\frac{1}{x^2 + y^2}}.$

**19.18.**  $\lim_{\substack{x \rightarrow \infty \\ y \rightarrow \infty}} \frac{(x+y)^2}{(x^2 + y^4)^2}.$

**19.19.**  $\lim_{\substack{x \rightarrow \infty \\ y \rightarrow \infty}} (x^2 + y^2) \sin \frac{1}{x^2 + y^2}.$

**19.20.** Ushbu  $\lim_{\substack{x \rightarrow 1 \\ y \rightarrow 1}} f(x, y)$  ni hisoblang, bunda

$$f(x, y) = \begin{cases} \frac{x^2 + 2xy - 3y^2}{x^3 - y^3}, & x \neq y \text{ bo'lganda,} \\ 4/3, & x = y \text{ bo'lganda.} \end{cases}$$

Quyidagi karrali limitlarning mavjud emasligini isbotlang:

**19.21.**  $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{x}{x+y}.$

**19.22.**  $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{x-y}{x+y}.$

**19.23.**  $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{x^2 - y^2}{x^2 + y^2}.$

**19.24.**  $\lim_{\substack{x \rightarrow 1 \\ y \rightarrow 0}} \frac{\ln(x+y)}{y}.$

**19.25.** Ushbu  $f(x, y) = \begin{cases} \frac{x^3 + y^3}{x^2 + y^2}, & (x, y) \neq (0, 0) \text{ bo'lganda,} \\ 0, & (x, y) = (0, 0) \text{ bo'lganda.} \end{cases}$

funksiyaning  $(0, 0)$  nuqtada karrali limiti mavjud emasligini ko'rsating.

**19.26.** Ushbu

$$f(x, y) = \begin{cases} \left(1 + \frac{1}{x+y}\right)^{x+y}, & x+y \neq 0 \text{ bo'lganda,} \\ 1, & x+y = 0 \text{ bo'lganda} \end{cases}$$

funksiyaning  $x \rightarrow \infty, y \rightarrow \infty$  dagi karrali limiti mavjud emasligini isbotlang.

Quyidagi  $\lim_{x \rightarrow x^0} \lim_{y \rightarrow y^0} f(x, y)$  va  $\lim_{y \rightarrow y^0} \lim_{x \rightarrow x^0} f(x, y)$  takroriy limitlarni hisoblang:

**19.27.**  $f(x, y) = \frac{x^2 + xy + y^2}{x^2 - xy + y^2}, \quad x^0 = 0, \quad y^0 = 0.$

**19.28.**  $f(x, y) = \frac{\sin(x+y)}{2x+3y}, \quad x^0 = 0, \quad y^0 = 0.$

**19.29.**  $f(x, y) = \frac{\cos x - \cos y}{x^2 + y^2}, \quad x^0 = 0, \quad y^0 = 0.$

**19.30.**  $f(x, y) = \frac{x^2 + y^2}{x^2 + y^4}, \quad x^0 = \infty, \quad y^0 = \infty.$

**19.31.**  $f(x, y) = \frac{x^y}{1+x^y}, \quad x^0 = \infty, \quad y^0 = 0.$

**19.32.**  $f(x, y) = \sin \frac{\pi x}{2x+y}, \quad x^0 = \infty, \quad y^0 = \infty.$

**19.33.**  $f(x, y) = \frac{1}{xy} \operatorname{tg} \frac{xy}{1+xy}, \quad x^0 = 0, \quad y^0 = \infty.$

$$19.34. f(x, y) = \log_x(x+y), \quad x^0 = 1, \quad y^0 = 0.$$

$$19.35. f(x, y) = \frac{\sin 3x + \operatorname{tg} 2y}{6x + 3y} \operatorname{tg} \frac{xy}{1+xy}, \quad x^0 = 0, \quad y^0 = 0.$$

Quyidagi berilgan funksiyalarning  $(x^0, y^0)$  nuqtada karrali va takroriy limitlari mavjudmi?

$$19.36. f(x, y) = \frac{x^2 - y^2}{x^2 + y^2}, \quad x^0 = 0, \quad y^0 = 0.$$

$$19.37. f(x, y) = \log_x(x+y), \quad x^0 = 1, \quad y^0 = 0.$$

$$19.38. f(x, y) = \frac{\sin x + \sin y}{x + y}, \quad x^0 = 0, \quad y^0 = 0.$$

### 20-§. Ko‘p o‘zgaruvchili funksiyaning uzluksizligi

**20.1. Uzluksiz funksiyaning ta’riflari.**  $u = f(M)$  funksiya  $\{M\} \subset R^n$  to‘plamda berilgan bo‘lib,  $A = A(a_1, a_2, \dots, a_m)$  nuqta  $\{M\}$  to‘plamning limit nuqtasi va  $A \in \{M\}$  bo‘lsin.

**20.1-ta’rif.** Agar  $M \rightarrow A$  da  $u = f(M)$  funksiyaning limiti mavjud bo‘lib,

$$\lim_{M \rightarrow A} f(M) = f(A) \text{ yoki } \lim_{\substack{x_1 \rightarrow a_1 \\ x_2 \rightarrow a_2 \\ \vdots \\ x_n \rightarrow a_n}} f(x_1, x_2, \dots, x_n) = f(a_1, a_2, \dots, a_m)$$

bo‘lsa, u holda  $f(M)$  funksiya  $A$  nuqtada uzluksiz deb ataladi,  $A = \lim_{M \rightarrow A} M$  bo‘lgani uchun, funksiyaning uzluksizlik shartini,

$$\lim_{M \rightarrow A} f(M) = f\left(\lim_{M \rightarrow A} M\right) \quad (20.1)$$

ko‘rinishda ham yozish mumkin.

$\{M\}$  to‘plamning funksiya uzlusizligi shartini qanoatlantirmaydigan nuqtalari funksiyaning *uzilish nuqtalari* deyiladi.

**20.2-ta’rif (Geyne ta’rifi).** Agar  $\{M\} \subset R^n$  to‘plamning nuqtalaridan tuzilgan,  $A \in \{M\}$  ga intiluvchi har qanday  $\{M_n\}$  ketma-ketlik olinganda ham, unga mos kelgan  $\{f(M_n)\}$  ketma-ketlik, hamma vaqt  $f(A)$  ga teng bo‘lsa,  $f(M)$  funksiya  $A$  nuqtada uzlusiz deb ataladi.

**20.3-ta’rif. (Koshi ta’rifi).** Agar  $\forall \varepsilon > 0$  son uchun, shunday  $\delta > 0$  topilsaki,  $\rho(M, A) < \delta$  tengsizlikni qanoatlantiruvchi barcha  $M \in \{M\}$  nuqtalarda,

$$|f(M) - f(A)| < \varepsilon$$

tengsizlik bajarilsa,  $f(M)$  funksiya  $A$  nuqtada uzlusiz deb ataladi.

Agar  $f(M)$  funksiya  $\{M\}$  to‘plamning har bir nuqtasida uzlusiz bo‘lsa, u holda  $f(M)$  funksiya  $\{M\}$  to‘plamda uzlusiz deyiladi.

Ushbu  $\Delta u = f(M) - f(A)$  ayirmaga  $f(M)$  funksiyaning  $A$  nuqtadagi *orttirmasi yoki to‘liq orttirmasi* deyiladi.

$A$  va  $M$  nuqtalar, mos ravishda,  $a_1, a_2, \dots, a_m$  va  $x_1, x_2, \dots, x_m$  koordinatalarga ega bo‘lsin. Ushbu

$$x_1 - a_1 = \Delta x_1, \quad x_2 - a_2 = \Delta x_2, \dots, x_m - a_m = \Delta x_m$$

belgilashlardan foydalanib, funksiya argumentlarining  $\Delta x_1, \Delta x_2, \dots, \Delta x_m$  orttirmalariga moc keluvchi orttirmasi uchun,

$$\Delta u = f(a_1 + \Delta x_1, a_2 + \Delta x_2, \dots, a_m + \Delta x_m) - f(a_1, a_2, \dots, a_m)$$

ifodani hosil qilamiz. Ravshanki,  $u = f(M)$  funksiyaning  $A$  nuqtada uzlusiz bo‘lishi uchun, uning orttirmasi  $A$  nuqtada cheksiz kichik bo‘lishi zarur va yetarli, ya’ni:

$$\lim_{M \rightarrow A} \Delta u = \lim_{M \rightarrow A} \Delta f = \lim_{M \rightarrow A} (f(M) - f(A)) = 0 \text{ yoki } \lim_{\substack{\Delta x_1 \rightarrow 0 \\ \Delta x_2 \rightarrow 0 \\ \dots \\ \Delta x_m \rightarrow 0}} \Delta u = 0 \quad (20.2)$$

bo‘lishi zarur va yetarli. (20.2) shartga  $u = f(M)$  funksiyaning  $A$  nuqtada uzlusizligining *ayirma shakli* deyiladi.

Ko‘p o‘zgaruvchili funksiyaning bitta argumenti bo‘yicha (qolganlari belgilangan deb) uzlusizlik tushunchasini ham kiritish mumkin. Bu tushunchani kiritish uchun,  $u = f(M) = f(x_1, x_2, \dots, x_m)$  funksiyaning, uning aniqlanish sohasiga tegishli  $M(x_1, x_2, \dots, x_m)$  nuqtadagi, xususiy *orttirmalari* deb ataluvchi tushunchalarini kiritamiz. Boshqa

argumentlari belgilangan deb qarab, funksiyaning birinchi argumentiga  $\Delta x_1$  orttirma beramiz. Ushbu

$$x_1 + \Delta x_1, \quad x_2, \dots, x_m$$

koordinatalarga ega bo'lgan nuqta funksiyaning aniqlanish sohasida yotsin.

Bu orttirma, funksiyaning  $M(x_1, x_2, \dots, x_m)$  nuqtadagi,  $x$  argumentning  $\Delta x_1$  orttirmasiga mos keluvchi, xususiy orttirmasi deyiladi va  $\Delta_{x_1} u$  kabi belgilanadi:

$$\Delta_{x_1} u = f(x_1 + \Delta x_1, x_2, \dots, x_m) - f(x_1, x_2, \dots, x_m).$$

Funksiyaning qolgan argumentlari orttirmalariga mos keluvchi xususiy orttirmalari ham, shunga o'xhash aniqlanadi:

$$\left. \begin{aligned} \Delta_{x_2} u &= f(x_1, x_2 + \Delta x_2, \dots, x_m) - f(x_1, x_2, \dots, x_m) \\ &\dots \\ \Delta_{x_m} u &= f(x_1, x_2, \dots, x_m + \Delta x_m) - f(x_1, x_2, \dots, x_m). \end{aligned} \right\}$$

Agar  $\Delta x_k \rightarrow 0$  da funksiyaning  $\Delta x_k f$  xususiy orttirmasi ham nolga intilsa, ya'ni  $\lim_{\Delta x_k \rightarrow 0} \Delta x_k f = 0$  bo'lsa,  $f(x_1, x_2, \dots, x_m)$  funksiya  $M(x_1, x_2, \dots, x_m)$  nuqtada  $x_k$  o'zgaruvchi bo'yicha uzluksiz deyiladi.

**20.1-eslatma.** Agar  $f(x_1, x_2, \dots, x_m)$  funksiya  $M_0(x_1^0, x_2^0, \dots, x_m^0) \in \{M\}$  nuqtada (bir yo'la) uzluksiz bo'lsa, funksiya shu nuqtada har bir o'zgaruvchi bo'yicha ham uzluksiz bo'ladi, lekin funksiyaning biror nuqtada har bir o'zgaruvchi bo'yicha xususiy uzluksiz bo'lidan, uning shu nuqtada (bir yo'la) uzluksiz bo'lishi har doim ham kelib chiqavermaydi.

### 20.1- misol. Ushbu

$$f(x, y) = \begin{cases} \frac{x^4 + x^2 y^2 + y^4}{x^2 + y^2}, & (x, y) \neq (0, 0) \text{ bo'lganda,} \\ 0, & (x, y) = (0, 0) \text{ bo'lganda} \end{cases}$$

funksiyaning  $R^2$  da uzluksiz ekanligini ko'rsating.

**Yechilishi.**  $\forall (a, b) \in R^2 \ ((a, b) \neq (0, 0))$  nuqtani olamiz:

$$\lim_{\substack{x \rightarrow a \\ y \rightarrow b}} f(x, y) = \lim_{\substack{x \rightarrow a \\ y \rightarrow b}} \frac{x^4 + x^2 y^2 + y^4}{x^2 + y^2} = \frac{a^4 + a^2 b^2 + b^4}{a^2 + b^2} = f(a, b)$$

tenglik o'rinni bo'ladi. Bu esa, berilgan funksiyaning 20.1-ta'rifga ko'ra,  $(a, b)$  nuqtada uzluksizligini bildiradi.

Endi, berilgan funksiyaning  $(0,0)$  nuqtada uzlusiz ekanligini ko'rsatamiz. Buning uchun quyidagi almashtirishni olamiz:

$$x = r \cos \varphi, \quad y = r \sin \varphi.$$

$$\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} f(x, y) = \lim_{r \rightarrow 0} f(r \cos \varphi, r \sin \varphi) = \lim_{r \rightarrow 0} r^2 (\cos^2 \varphi + \sin^2 \varphi) = 0$$

Demak,  $\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} f(x, y) = f(0, 0) = 0$ . Bundan  $f(x, y)$  funksiyaning  $(0, 0)$

nuqtada uzlusiz ekanligi kelib chiqadi.

**20.2- misol.** Ushbu  $f(x, y) = 2x - 3y + z$  funksiyaning  $R^2$  da uzlusiz ekanligini ko'rsating.

Yechilishi  $\forall \varepsilon > 0$  songa ko'ra,  $\delta = \frac{\varepsilon}{6}$  deb olinsa, u holda,

$$\rho(M(x, y, z), M_0(x_0, y_0, z_0)) = \sqrt{(x - x_0)^2 + (y - y_0)^2 + (z - z_0)^2} < \delta$$

tengsizlikni qanoatlantiruvchi  $\forall M(x, y, z) \in R^m$  nuqtalarda,

$$|f(x, y, z) - f(x_0, y_0, z_0)| = |(2x - 3y + z) - (2x_0 - 3y_0 + z_0)| \leq |2(x - x_0)| + |3(y - y_0)| + |z - z_0| \leq 6\sqrt{(x - x_0)^2 + (y - y_0)^2 + (z - z_0)^2} < 6\delta = \varepsilon$$

tengsizlik o'rinni bo'ldi. Bundan, 20.3- ta'rifga ko'ra,  $f(x, y) = 2x - 3y + z$  funksiyaning  $\forall M_0(x_0, y_0, z_0)$  nuqtada uzlusizligi kelib chiqadi.

**20.3-misol.** Ushbu  $f(x, y) = \frac{x - 2y + 4}{x^2 + y^2 + 3}$  funksiyaning  $\forall M_0(x_0, y_0) \in R^2$

nuqtada uzlusiz ekanligini ko'rsating.

Yechilishi.  $M_0(x_0, y_0)$  nuqtaga  $\Delta x, \Delta y$  ortirmalar berib, berilgan funksiyaning to'liq ortirmasini topamiz:

$$\begin{aligned} \Delta f(x_0, y_0) &= f(x_0 + \Delta x, y_0 + \Delta y) - f(x_0, y_0) = \\ &= \frac{(x_0 + \Delta x) - 2(y_0 + \Delta y) + 4}{(x_0 + \Delta x)^2 + (y_0 + \Delta y)^2 + 3} - \frac{x_0 - 2y_0 + 4}{x_0^2 + y_0^2 + 3} = \\ &= \frac{(x_0^2 + y_0^2 + 3)[(x_0 + \Delta x) - 2(y_0 + \Delta y) + 4] - (x_0 - 2y_0 + 4)[(x_0 + \Delta x)^2 + (y_0 + \Delta y)^2 + 3]}{(x_0^2 + y_0^2 + 3)[(x_0 + \Delta x)^2 + (y_0 + \Delta y)^2 + 3]} \end{aligned}$$

Bu tenglikdan  $\lim_{\substack{\Delta x \rightarrow 0 \\ \Delta y \rightarrow 0}} \Delta f(x_0, y_0) = 0$  ekanligi kelib chiqadi. (20.2) shartga

ko'ra, berilgan funksiyaning  $\forall M_0(x_0, y_0)$  nuqtada uzlusiz ekanligi kelib chiqadi.

**20.4- misol.** Ushbu

$$f(x, y) = \begin{cases} \frac{x^2 y^2}{x^4 + y^4}, & x^4 + y^4 \neq 0 \text{ bo'lганда,} \\ 0, & x^4 + y^4 = 0 \text{ bo'lғанда} \end{cases}$$

funksiyaning  $O(0,0)$  nuqtada har bir o'zgaruvchisi bo'yicha uzlusiz, ikkala o'zgaruvchisi bo'yicha bir yo'la uzlusiz emasligini ko'rsating.

**Yechilishi.**  $f(x,y)$  funksiyaning  $O(0,0)$  nuqtadagi xususiy ortirmalarini qaraymiz:  $x$  bo'yicha xususiy ortirmasi

$$\Delta_x u = f(\Delta x, 0) - f(0, 0) = 0 - 0 = 0.$$

Ravshanki,  $\lim_{\Delta x \rightarrow 0} \Delta_x u = 0$ . Bundan  $f(x,y)$  funksiyaning  $O(0,0)$  nuqtada  $x$  argument bo'yicha uzlusizligi kelib chiqadi.

Xudi shunday,  $f(x,y)$  funksiyaning  $O(0,0)$  nuqtada  $y$  argument bo'yicha ham uzlusizligi ko'rsatiladi.

Endi,  $f(x,y)$  funksiyaning  $O(0,0)$  nuqtada ikkala o'zgaruvchi bo'yicha bir yo'la uzlusiz emasligini ko'rsatamiz.  $M(x,y)$  nuqta  $O(0,0)$  nuqtaga,  $O(0,0)$  nuqtadan o'tuvchi  $y = kx$  to'g'ri chiziqlar bo'yab intilsin. U holda,

$$\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0 \\ y=kx}} \frac{x^2 y^2}{x^4 + y^4} = \lim_{x \rightarrow 0} \frac{k^2 x^4}{x^4 + k^4 x^4} = \frac{k^2}{1+k^4}.$$

Demak,  $M(x,y)$  nuqta, turli to'g'ri chiziqlar ( $k$  ning har xil qiymatida) bo'yicha,  $O(0,0)$  nuqtaga intilganda limitning qiymati turilcha bo'ladi. Bu hol, qaralayotgan limitning mavjud emasligini bildiradi. Shunday qilib, berilgan funksiyaning  $O(0,0)$  nuqtadagi karrali limiti mavjud emas ekan.

### 20.5- misol Ushbu

$$u = f(x,y) = \begin{cases} \frac{\cos x - \cos y}{x - y}, & x - y \neq 0 \text{ bo'lganda,} \\ 0, & x - y = 0 \text{ bo'lganda} \end{cases}$$

funksiyani  $O(0,0)$ ,  $A\left(\frac{\pi}{4}, \frac{\pi}{4}\right)$  nuqtalarda har bir argamenti va ikkala argumenti bo'yicha bir yo'la uzlusizlikka tekshiring.

**Yechilishi.** Kosinuslar ayirmasi formulasidan foydalanim, berilgan funksiyani quyidagi ko'rinishda yozib olamiz:

$$f(x,y) = \begin{cases} \frac{-2 \sin \frac{x+y}{2} \sin \frac{x-y}{2}}{x-y}, & x - y \neq 0 \text{ bo'lganda,} \\ 0, & x - y = 0 \text{ bo'lganda,} \end{cases}$$

$$1) \lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} f(x,y) = -\lim_{x \rightarrow 0} \sin \frac{x+y}{2} \lim_{y \rightarrow 0} \frac{\sin \frac{x-y}{2}}{\frac{x-y}{2}} = -\lim_{x \rightarrow 0} \sin \frac{x+y}{2} \lim_{y \rightarrow 0} \frac{\sin \frac{t}{2}}{\frac{t}{2}} = 0 \cdot 1 = 0 = f(0,0).$$

Demak,  $f(x, y)$  funksiya  $\sigma(0,0)$  nuqtada ikkala argumenti bo'yicha bir yo'la uzlusiz. U holda, 20.1-eslatmaga asosan, har bir argumenti bo'yicha ham uzlusiz bo'ladi.

$$2) \lim_{\substack{x \rightarrow \frac{\pi}{4} \\ y \rightarrow \frac{\pi}{4}}} f(x, y) = - \lim_{\substack{x \rightarrow \frac{\pi}{4} \\ y \rightarrow \frac{\pi}{4}}} \sin(x+y) \lim_{\substack{x \rightarrow \frac{\pi}{4} \\ y \rightarrow \frac{\pi}{4}}} \frac{\sin \frac{x-y}{2}}{\frac{x-y}{2}} = -1,$$

lекин  $f\left(\frac{\pi}{4}; \frac{\pi}{4}\right) = 0$  bo'lgani uchun,  $f(x, y)$  funksiya  $A\left(\frac{\pi}{4}; \frac{\pi}{4}\right)$  nuqtada ikkala argumenti bo'yicha bir yo'la uzlusiz emas.

$$\text{Ushbu } f\left(x, \frac{\pi}{4}\right) = \begin{cases} -2 \sin \frac{x+\frac{\pi}{4}}{2} \sin \frac{x-\frac{\pi}{4}}{2}, & x \neq \frac{\pi}{4} \text{ bo'lganda,} \\ 0, & x = \frac{\pi}{4} \text{ bo'lganda} \end{cases}$$

funksiyani qaraymiz. Funksiyaning berilishiga ko'ra,  $\forall x$  uchun  $f\left(x, \frac{\pi}{4}\right) = 0$ , jumladan, u  $x = \frac{\pi}{4}$  da ham nolga teng bo'ladi.

$$\lim_{x \rightarrow \frac{\pi}{4}} f\left(x, \frac{\pi}{4}\right) = \lim_{x \rightarrow \frac{\pi}{4}} \frac{-2 \sin \frac{x+\frac{\pi}{4}}{2} \sin \frac{x-\frac{\pi}{4}}{2}}{x - \frac{\pi}{4}} = - \lim_{x \rightarrow \frac{\pi}{4}} \sin \frac{x+\frac{\pi}{4}}{2} \lim_{x \rightarrow \frac{\pi}{4}} \frac{\sin \frac{x-\frac{\pi}{4}}{2}}{x - \frac{\pi}{4}(x - \frac{\pi}{4})/2} = \\ = -\frac{\sqrt{2}}{2} \cdot 1 = -\frac{\sqrt{2}}{2} \neq f\left(\frac{\pi}{4}, \frac{\pi}{4}\right) = 0.$$

Demak,  $f\left(x, \frac{\pi}{4}\right)$  funksiya  $x = \frac{\pi}{4}$  da uzlusiz emas.

Endi

$$f\left(\frac{\pi}{4}, y\right) = \begin{cases} -2 \sin \frac{\frac{\pi}{4}+y}{2} \sin \frac{\frac{\pi}{4}-y}{2}, & y \neq \frac{\pi}{4} \text{ bo'lganda,} \\ 0, & y = \frac{\pi}{4} \text{ bo'lganda} \end{cases}$$

funksiyani qaraymiz. Funksiyaning berilishiga ko'ra,  $\forall y$  uchun,

$$\lim_{y \rightarrow \frac{\pi}{4}} f\left(\frac{\pi}{4}, y\right) = \lim_{y \rightarrow \frac{\pi}{4}} \frac{-2 \sin \frac{\frac{\pi}{4}+y}{2} \sin \frac{\frac{\pi}{4}-y}{2}}{\frac{\pi}{4}-y} = - \lim_{y \rightarrow \frac{\pi}{4}} \sin \frac{\frac{\pi}{4}+y}{2} \lim_{y \rightarrow \frac{\pi}{4}} \frac{\sin \frac{\frac{\pi}{4}-y}{2}}{\frac{\pi}{4}-y(\frac{\pi}{4}-y)/2} =$$

$$= -\frac{\sqrt{2}}{2} \cdot 1 = -\frac{\sqrt{2}}{2} \neq f\left(\frac{\pi}{4}, \frac{\pi}{4}\right) = 0.$$

Demak,  $f\left(\frac{\pi}{4}, y\right)$  funksiya  $y = \frac{\pi}{4}$  nuqtada uzluksiz emas ekan.

## 20.6- misol Ushbu

$$f(x, y) = \frac{x + y}{x^3 + y^3}$$

funksiyaning uzilish nuqtalarini toping.

**Yechilishi.** Berilgan funksiya, kasr rasional funksiya bo'lib, uning surati ham, maxraji ham uzluksiz funksiyalardan iborat. Shuning uchun, funksiyaning uzilish nuqtalari,  $x^3 + y^3 = 0$  shartni qanoatlantiruvchi nuqtalardan iborat bo'ladi. Bu tenglamani  $y$  ga nisbatan echamiz:  $y = -x$ .

Shunday qilib, berilgan funksiyaning uzilish nuqtalari,  $y = -x$  to'g'ri chiziqning nuqtalaridan iborat ekan.

$x_0 \neq 0$ ,  $y_0 \neq 0$  va  $x_0 + y_0 = 0$  bo'lsin. U holda,

$$\lim_{\substack{x \rightarrow x_0 \\ y \rightarrow y_0}} \frac{x + y}{x^3 + y^3} = \lim_{\substack{x \rightarrow x_0 \\ y \rightarrow y_0}} \frac{1}{x^2 - xy + y^2} = \frac{1}{x_0^2 - x_0 y_0 + y_0^2}.$$

Demak,  $y = -x$  ( $x \neq 0$ ) to'g'ri chiziqning nuqtalari,  $f(x, y) = \frac{x + y}{x^3 + y^3}$

funksiyaning yo'qotilishi mumkin bo'lgan (birinchi tur) uzilish nuqtalari bo'lar ekan.

$$\lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{x + y}{x^3 + y^3} = \lim_{\substack{x \rightarrow 0 \\ y \rightarrow 0}} \frac{1}{x^2 - xy + y^2} = +\infty$$

munosabatdan esa,  $O(0,0)$  nuqta berilgan funksiyaning cheksiz (ikkinchisi tur) uzilish nuqtasi ekanligi kelib chiqadi.

**20.2. Uzluksiz funksiyalar ustida arifmetik amallar.** Murakkab funksiyaning uzluksizligi.  $u = f(M)$  va  $v = g(M)$  funksiyalar  $\{M\} \subset R^n$  to'plamda berilgan,  $A \in R^n$  nuqta esa,  $\{M\}$  to'plamning limit nuqtasi va  $A \in \{M\}$  bo'lsin.

**20.1-teorema.** Agar  $f(M)$  va  $g(M)$  funksiyalar  $A$  nuqtada uzluksiz bo'lsa,  $f(M) \pm g(M)$ ,  $f(M) \cdot g(M)$  hamda  $\frac{f(M)}{g(M)}$  ( $g(A) \neq 0$ ) funksiyalar ham shu nuqtada uzluksiz bo'ladi.

**20.2-eslatma.** Ikkita funksiyaning yig'indisi, ayirmasi, ko'paytmasi va nisbati uzlusizligidan, ulardan har birining uzlusizligi har doim ham kelib chiqar vermaydi.

**20.7-misol.** Ushbu  $\{M\} = \{(x, y) \in R^2 : |x| \leq 1, y \leq 1\} \subset R^2$  to'plamning rasional nuqtalari ( har ikkala koordinatasi ham rasional son ) to'plamini  $\{M_p\}$  deb belgilaymiz.  $\{M\}$  to'plamda

$$f_1(x, y) = \begin{cases} 1, & (x, y) \in \{M_p\} \\ 0, & (x, y) \in \{M\}/\{M_p\} \end{cases}$$

va

$$f_2(x, y) = \begin{cases} -1, & (x, y) \in \{M_p\} \\ 0, & (x, y) \in \{M\}/\{M_p\} \end{cases}$$

funksiyalarni qaraymiz. Bu funksiyalarning yig'indisi  
 $f_1(x, y) + f_2(x, y) = 0 \quad ((x, y) \in \{M\})$

bo'lib, u shu to'plamda uzlusiz, lekin  $f_1(x, y), f_2(x, y)$  funksiyalarning har biri  $\{M\}$  to'plamda uzlusiz emas.

**20.3-eslatma.** Yuqoridagi 20.1-teorema qo'shiluvchilar soni ixtiyoriy chekli bo'lgan holda ham o'rinni.

$u = f(M) = f(x_1, x_2, \dots, x_m)$  funksiya  $\{M\}$  ( $\{M\} \subset R^n$ ) to'plamda berilgan bo'lib,  $x_1, x_2, \dots, x_m$  o'zgaruvchilarning har biri, o'z navbatida,  $\{N\}$  ( $\{N\} \subset R^k$  ( $k = 1, 2, \dots$ ))) to'plamda,

$$\left. \begin{array}{l} x_1 = \varphi_1(t_1, t_2, \dots, t_k), \\ x_2 = \varphi_2(t_1, t_2, \dots, t_k), \\ \dots \\ x_m = \varphi_m(t_1, t_2, \dots, t_k) \end{array} \right\} \quad (20.3)$$

ko'rinishda berilgan bo'lsin.  $t = (t_1, t_2, \dots, t_k) \in \{N\} \subset R^k$  bo'lganda  $M = M(x_1, x_2, \dots, x_m) \in \{M\} \subset R^n$  deb qaraymiz. Natijada, har bir  $M(x_1, x_2, \dots, x_m) \in \{M\}$  nuqtaga, (20.3) formula yordamida,  
 $u = f(\varphi_1(t_1, t_2, \dots, t_k), \varphi_2(t_1, t_2, \dots, t_k), \dots, \varphi_m(t_1, t_2, \dots, t_k)) = F(t_1, t_2, \dots, t_k) = F(t)$

nuqta mos qo'yiladi, ya'ni murakkab funksiya hosil bo'ladi.

**20.2-teorema.** Agar  $\varphi_i(t_1, t_2, \dots, t_k)$  ( $i = 1, 2, \dots, m$ ) funksiyalarning har biri  $t_0 = (t_1^0, t_2^0, \dots, t_k^0)$  nuqtada uzlusiz bo'lib,  $f(M) = f(x_1, x_2, \dots, x_m)$  funksiya esa,  $t_0 = (t_1^0, t_2^0, \dots, t_k^0)$  nuqtaga mos,

$M_0(x_0) = (x_1^0, x_2^0, \dots, x_m^0) \nmid x_1^0 = \varphi_1(t_1^0, t_2^0, \dots, t_k^0), x_2^0 = \varphi_2(t_1^0, \dots, t_k^0), \dots, x_m^0 = \varphi_m(t_1^0, t_2^0, \dots, t_k^0))$   
 nuqtada uzlusiz bo'lsa,  $u = F(t_1, t_2, \dots, t_k)$  murakkab funksiya  $t_0 = (t_1^0, t_2^0, \dots, t_k^0)$  nuqtada uzlusiz bo'ladi.

**20.3. Nuqtada uzlusiz bo'lgan funksiyalarning lokal xossalari.**  $u = f(M)$  funksiya  $\{M\} \subset R^m$  to'plamda berilgan bo'lsin. Bu to'plamdan  $M_0(x_1^0, \dots, x_m^0) \in \{M\}$  nuqtani olib, uning etarli kichik atrofini qaraymiz.

**1-xossa.** Agar  $f(M)$  funksiya  $M_0$  nuqtada uzlusiz bo'lsa, u holda, funksiya  $M_0$  nuqtaning etarli kichik atrofida chegaralangan bo'ladi.

**2-xossa.** Agar  $f(M)$  funksiya  $M_0$  nuqtada uzlusiz bo'lib,  $f(M_0) > 0$  ( $f(M) < 0$ ) bo'lsa,  $M_0$  nuqtaning etarli kichik atrofidagi  $M$  nuqtalarda ham  $f(M) > 0$  ( $f(M) < 0$ ) bo'ladi.

**3-xossa.** Agar  $f(M)$  funksiya  $M_0$  nuqtada uzlusiz bo'lsa,  $M_0$  nuqtaning etarli kichik atrofidagi ixtiyoriy  $M_1 \in \{M\}$ ,  $M_2 \in \{M\}$  nuqtalar uchun,  $|f(M_1) - f(M_2)| < \varepsilon$  tengsizlik o'rinni bo'ladi.

#### 20.4. Uzlusiz bo'lgan funksiyalarning global xossalari.

**20.4-ta'rif.** Agar shunday  $c$  va  $C$  sonlar mavjud bo'lib,  $\forall M \in \{M\}$  uchun  $c \leq f(M) \leq C$  tengsizlik o'rinni bo'lasa,  $u = f(M)$  funksiya shu  $\{M\}$  to'plamda chegaralangan deyiladi.

**20.3-teorema(Bolsano-Koshining birinchi teoremasi).**  $u = f(M)$  funksiya  $\{M\} \subset R^m$  bog'lamli to'plamda berilgan va uzlusiz bo'lsin. Agar bu funksiya to'plamning ikkita  $A(a_1, a_2, \dots, a_m) \in \{M\}$ ,  $B(b_1, b_2, \dots, b_m) \in \{M\}$  nuqtasida har xil ishorali qiyamatlarga ega bo'lsa, u holda, shunday  $C(c_1, c_2, \dots, c_m) \in \{M\}$  nuqta topiladiki, shu nuqtada funksiya nolga aylanadi, ya'ni  $f(C) = f(c_1, c_2, \dots, c_m) = 0$ .

**20.4-teorema(Bolsano-Koshining ikkinchi teoremasi).**  $u = f(M)$  funksiya  $\{M\} \subset R^m$  bog'lamli to'plamda berilgan va uzlusiz bo'lib,  $\{M\}$  to'plamning ikkita  $A(a_1, a_2, \dots, a_m)$ ,  $B(b_1, b_2, \dots, b_m)$  nuqtasida  $f(A) \neq f(B)$  bo'lsa, u holda,  $f(A)$  va  $f(B)$  qiyatlar orasida har qanday  $C$  son olinsa ham,  $\{M\}$  to'plamda shunday  $C(c_1, c_2, \dots, c_m)$  nuqta topiladiki,  $f(C) = f(c_1, c_2, \dots, c_m) = C$  bo'ladi.

**20.5-teorema (Veyershtrassning birinchi teoremasi).** Agar  $u = f(M)$  funksiya,  $\{M\} \subset R^m$  – chegaralangan yopiq to'plamda berilgan va uzlusiz bo'lsa, funksiya shu  $\{M\}$  to'plamda chegaralangan bo'ladi.

**20.6- teorema(Veyershtrassning ikkinchi teoremasi).** Agar  $f(M)$  funksiya chegaralangan yopiq  $\{M\} \subset R^m$  to'plamda uzlusiz bo'lsa, u shu to'plamda o'zining aniq yuqori hamda aniq quyi chegarasiga erishadi.

**20.5. Ko'p o'zgaruvchili funksiyaning tekis uzlusizligi.**  $f(M)$  funksiya  $\{M\} \subset R^m$  to'plamda berilgan bo'lsin.

**20.4- ta'rif.** Agar  $\forall \varepsilon > 0$  son uchun, shunday  $\delta > 0$  topilsaki,  $\{M\}$  to'plamning  $\rho(M', M'') < \delta$  tengsizlikni qanoatlantiruvchi  $\forall M', M'' \in \{M\}$  nuqtalarida

$$|f(M') - f(M'')| < \varepsilon$$

tengsizlik bajarilsa,  $f(M)$  funksiya  $\{M\}$  to'plamda *tekis uzlaksiz* deyiladi.

**20.4-eslatma.** Funksiyaning tekis uzlaksizligi ta'rividagi  $\delta > 0$  son faqat  $\varepsilon > 0$  ga bog'liq bo'ladi.

**20.7-teorema (Kantor teoremasi).** Agar  $f(M)$  funksiya chegaralangan yopiq to'plamda berilgan va uzlaksiz bo'lsa, funksiya shu to'plamda tekis uzlaksiz bo'ladi.

**20.5-eslatma.** Chegaralangan  $\{M\}$  to'plamning  $\forall M', M'' \in \{M\}$  nuqtalari orasidagi  $\rho(M', M'')$  masofaning aniq yuqori chegarasiga  $\{M\}$  to'plamning *diametri* deyiladi.

**Natija.** Agar  $f(M)$  funksiya chegaralangan yopiq to'plamda berilgan va uzlaksiz bo'lsa, u holda  $\forall \varepsilon > 0$  son uchun shunday  $\delta > 0$  topilib,  $\{M\}$  to'plamni, *diametri*  $\delta$  dan kichik bo'lgan,  $\{M_i\} \subset \{M\}$  ( $i = 1, 2, \dots, k$ ) bo'laklarga bo'lganimizda, bu bo'laklarning har birida ham,  $f(M)$  funksiyaning tebranishi  $\varepsilon$  dan kichik bo'ladi.

**20.8-misol.** Ushbu  $u = \frac{x^3 + y^3}{x^2 + y^2}$  funksiyani  $\{M\} = \{(x, y) : 0 < x^2 + y^2 \leq 1\}$  to'plamda tekis uzlaksizlikka tekshiring.

**Yechilishi.** Berilgan funksiyaning surati  $x^3 + y^3$  va maxraji  $x^2 + y^2$   $\{M\}$  to'plamda uzlaksiz. Demak, funksiya  $\{M\}$  da uzlaksiz ( $O(0,0) \notin \{M\}$ ).  $\{M\}$  to'plam yopiq to'plam emas. Shuning uchun, bu holda Kantor teoremasini qo'llab bo'lmaydi, lekin  $u(x, y)$  funksiyani  $O(0,0)$  nuqtada qayta aniqlasak, ya'ni  $u(0,0) = 0$  desak, u holda  $u(x, y)$  funksiya  $O(0,0)$  nuqtada uzlaksiz bo'ladi. Haqiqatan ham,  $x = \rho \cos \varphi$ ,  $y = \rho \sin \varphi$  almashtirishni olsak,  $x \rightarrow 0$ ,  $y \rightarrow 0$  da  $\rho \rightarrow 0$ , ya'ni  $\lim_{y \rightarrow 0} u(x, y) = \lim_{\rho \rightarrow 0} u(\rho \cos \varphi, \rho \sin \varphi) = \lim_{\rho \rightarrow 0} \rho = 0$ . Shunday qilib,  $u(x, y)$  funksiyani  $O(0,0)$  nuqtada qayta aniqlasak, ya'ni  $u(0,0) = 0$  desak, u holda berilgan funksiya  $\overline{\{M\}} = \{(x, y) : x^2 + y^2 \leq 1\}$  yopiq to'plamda uzlaksiz bo'ladi. Demak, Kantor teoremasiga asosan, berilgan funksiya, markazi  $O(0,0)$  olib tashlangan  $\overline{\{M\}}$ -doirada, ya'ni  $\{M\}$  to'plamda tekis uzlaksiz bo'ladi.

**20.9- misol** Ushbu  $u = f(x, y) = \arcsin \frac{x}{y}$  funksiyani aniqlanish sohasida tekis uzlaksizlikka tekshiring.

**Yechilishi.** Berilgan funksiyaning aniqlanish sohasi:

$$\{M\} = \{(x, y) : |x| \leq |y|, y \neq 0\}.$$

Bu sohada  $f(x, y) = \arcsin \frac{x}{y}$  funksiya uzlusiz funksiyalarning superpozisiyasi sifatida, uzlusiz. Endi bu funksiyani  $\{M\}$  sohada tekis uzlusizlikka tekshiramiz:  $M_n \left( \frac{1}{n}; \frac{1}{n} \right), M_n' \left( \frac{1}{n}; -\frac{1}{n} \right)$  ( $n = 1, 2, \dots$ ) nuqtalar uchun

$$d(M_n, M_n') = \sqrt{\left( \frac{1}{n} - \frac{1}{n} \right)^2 + \left( \frac{1}{n} + \frac{1}{n} \right)^2} = \frac{2}{n} \xrightarrow{n \rightarrow \infty} 0.$$

Funksiyaning bu nuqtalardagi qiymatlari,

$$|u(M_n) - u(M_n')| = |\arcsin 1 - \arcsin(-1)| = 2\arcsin 1 = \pi > 1 = \varepsilon$$

munosabatni qanoatlantiradi, ya'ni 20.4- ta'rifning sharti bajarilmaydi.

Demak, berilgan funksiya  $\{M\}$  to'plamda tekis uzlusiz emas.

### Mustaqil yechish uchun misollar

Quyidagi funksiyalarning uzilish nuqtalarini toping:

$$20.3. u = \ln(9 - x^2 - y^2)$$

$$20.4. u = \frac{xy}{x + y}$$

$$20.5. u = \sin \frac{x}{y}$$

$$20.6. u = \sin \frac{1}{xy}$$

Quyidagi funksiyalarning hamma uzilish nuqtalarini toping va ular ichida ikkala argument bo'yicha yo'qotilishi mumkin bo'lgan uzilish nuqtalarini ko'rsating:

$$20.7. u = \frac{x^3}{x^2 + y^2}$$

$$20.8. u = \frac{x^2}{x^2 + y^2}$$

$$20.9. u = \begin{cases} \frac{x^3 + y^3}{x + y}, & x + y \neq 0 \text{ bo'lганда,} \\ 3, & x + y = 0 \text{ bo'lганда.} \end{cases}$$

$$20.10. u = \frac{1}{\sin^2 x + \sin^2 y}, \quad 20.11. u = x \sin \frac{x^2}{x^2 + y^2}$$

$$20.12. u = \frac{\sin^2 x \cdot \sin y}{\sin^4 x + \sin^2 y}$$

$$20.13. u = \begin{cases} (x^2 + y^2 - 1) \sin \frac{1}{1 - x^2 - y^2}, & x^2 + y^2 \neq 1 \text{ bo'lганда,} \\ 0, & x^2 + y^2 = 1 \text{ bo'lганда.} \end{cases}$$

Quyidagi funksiyalarni ko'rsatilgan nuqtalarda har bir argumentni va hamma argumentlari bo'yicha bir yo'l uzlusizlikka tekshiring:

$$20.14. \quad u = \begin{cases} \frac{x^2 y^2}{x^4 + y^4}, & x^4 + y^4 \neq 0 \text{ bo'lganda, } O(0;0) \text{ va } A(1;2) \\ 0, & x^4 + y^4 = 0 \text{ bo'lganda,} \end{cases} .$$

$$20.15. \quad u = \begin{cases} \frac{x^3 y^2}{x^4 + y^4}, & x^4 + y^4 \neq 0 \text{ bo'lganda, } O(0;0) \text{ va } A(10^{-4}; 10^{-5}) \\ 0, & x^4 + y^4 = 0 \text{ bo'lganda,} \end{cases} .$$

$$20.16. \quad u = \begin{cases} \frac{x^2 + y^2}{x + y}, & x^4 + y^4 \neq 0 \text{ bo'lganda, } O(0;0) \text{ va } A(1;-1) \\ 0, & x^4 + y^4 = 0 \text{ bo'lganda,} \end{cases} .$$

$$20.17. \quad u = \begin{cases} \frac{x^2 - y^2}{x^2 + y^2}, & x^2 + y^2 \neq 0 \text{ bo'lganda, } O(0;0) \text{ va } A(0;1) \\ 1, & x^2 + y^2 = 0 \text{ bo'lganda,} \end{cases} .$$

$$20.18. \quad u = \begin{cases} \frac{\sin x + \sin y}{x + y}, & x + y \neq 0 \text{ bo'lganda, } O(0;0) \text{ va } A\left(\frac{\pi}{3}, -\frac{\pi}{3}\right) \\ 1, & x + y = 0 \text{ bo'lganda,} \end{cases}$$

Quyidagi funksiyalarining ko'rsatilgan sohada chegaralangan yoki chegaralanmagan ekanligini aniqlang:

$$20.19. \quad u = x^2 - y^2, \quad \{M\} = \{(x, y) : x^2 + y^2 \leq 25\}.$$

$$20.20. \quad u = x^2 - y^2, \quad \{M\} = \{(x, y) : x^2 + y^2 > 25\}.$$

$$20.21. \quad u = \frac{ax^2 + by^2}{x^2 + y^2}, \quad x^2 + y^2 \neq 0, (a \text{ va } b \text{ haqiqiy sonlar}).$$

$$20.22. \quad u = \frac{\sin(x+y) - \sin(x-y)}{xy}, \quad xy \neq 0.$$

$$20.23. \quad \text{Ushbu } u = \begin{cases} \frac{xy}{x^2 + y^2}, & x^2 + y^2 \neq 0 \text{ bo'lganda,} \\ 0, & x^2 + y^2 = 0 \text{ bo'lganda} \end{cases}$$

funksiya  $O(0,0)$  nuqtada: 1)  $x$  bo'yicha uzlusiz; 2)  $y$  bo'yicha uzlusiz; 3) ikkala argumenti bo'yicha bir yo'la uzlusiz bo'ladi mi?

20.24.  $a$  ning qanday qiymatida ushbu

$$u = \begin{cases} \frac{x^2 - y^2}{x^2 + y^2}, & x^2 + y^2 \neq 0 \text{ bo'lganda,} \\ a, & x^2 + y^2 = 0 \text{ bo'lganda} \end{cases}$$

funksiya  $O(0,0)$  nuqtada: 1)  $x$  bo'yicha uzlusiz; 2)  $y$  bo'yicha uzlusiz; 3)  $y = k\sqrt{x}$ , ( $k \neq 0$ ) chiziq bo'yicha uzlusiz; 4) ikkala argumenti bo'yicha bir yo'la uzlusiz bo'ladi mi?

20.25.  $a$  ning qanday qiymatida ushbu

$$u = \begin{cases} \frac{x^3 - xy^2}{x^2 + y^2}, & x^2 + y^2 \neq 0 \text{ bo'lganda,} \\ a, & x^2 + y^2 = 0 \text{ bo'lganda} \end{cases}$$

funksiya  $O(0,0)$  nuqtada: 1)  $x=\alpha t$ ,  $y=\beta t$  ( $\alpha^2 + \beta^2 \neq 0$ ) chiziq bo'yicha uzluksiz; 2) ikkala argumenti bo'yicha bir yo'la uzluksiz bo'ladi?

$$20.26. \text{Ushbu } u = \begin{cases} \frac{x^2 y}{x^4 + y^4}, & x^4 + y^4 \neq 0 \text{ bo'lganda,} \\ 0, & x^4 + y^4 = 0 \text{ bo'lganda} \end{cases}$$

funksiyaning  $O(0,0)$  nuqtada:  $x=t \cos \alpha$ ,  $y=t \sin \alpha$  ( $0 \leq t < \infty$ ) chiziq bo'yicha uzluksizligini; ikkala argumenti bo'yicha bir yo'la uzilishga ega ekanligini ko'rsating.

20.27.  $a$  ning qanday qiymatida ushbu

$$u = \begin{cases} \frac{1}{x+y} e^{-\frac{1}{|x+y|}}, & x+y \neq 0 \text{ bo'lganda,} \\ a, & x+y = 0 \text{ bo'lganda} \end{cases}$$

funksiya  $R^2$  da uzluksiz bo'ladi.

20.28.  $a$  va  $b$  ning qanday qiymatlarida ushbu

$$u = \begin{cases} a, & x^2 + y^2 \leq 4 \text{ bo'lganda,} \\ b, & \sqrt{9-x^2-y^2} - \sqrt{x^2+y^2-4}, \quad 4 < x^2 + y^2 \leq 9 \text{ bo'lganda,} \\ c, & x^2 + y^2 > 9 \text{ bo'lganda} \end{cases}$$

funksiya  $R^2$  da uzluksiz bo'ladi?

Quyidagi funksiyalarning ko'rsatilgan sohada chegaralanganligini isbotlang, uning aniq chegaralarini toping hamda funksiyaning aniq chegaralariga erishishi yoki erishmasligini aniqlang:

$$20.29. \ u = \frac{x^2 - y^2}{x^2 + y^2}, \ x^2 + y^2 \neq 0 .$$

$$20.30. \ u = \frac{x^6 - y^6}{x^2 + y^2}, \ \{M\} = \{(x, y) : 0 < x^2 + y^2 \leq 9\} .$$

$$20.31. \ u = \frac{x^2 y^2}{x^4 + y^4}, \ x^4 + y^4 \neq 0 .$$

$$20.32. \ u = x y e^{-xy}, \ \{M\} = \{(x, y) : x \geq 0, y \geq 0\} .$$

Quyidagi funksiyalarning ko'rsatilgan to'plamda tekis uzluksiz ekanligini ta'rifga asosan isbotlang:

$$20.33. \ u = ax + by + c, \ (a \neq 0, b \neq 0), \ R^2 .$$

$$20.34. \ u = x^2 + y^2, \ \{M\} = \{(x, y) : x^2 + y^2 \leq 1\} .$$

$$20.35. \ u = \sqrt{x^2 + y^2}, \ \{M\} = \{(x, y) : |x| < \infty, |y| < \infty\} .$$

$$20.36. \ u = \sqrt{x^2 + y^2 + z^2}, \ R^3 .$$

$$20.37. \ u = x^3 - y^3, \ \{M\} = \{(x, y) : 1 \leq x \leq 2, 0 \leq y \leq 2\} .$$

**20.38.**  $u = \frac{x^4 + y^4}{x^2 + y^2}$ ,  $\{M\} = \{(x, y) : 0 < x^2 + y^2 \leq 25\}$  .

## 21 -§. Ko‘p o‘zgaruvchili funksiyaning xususiy hosilalari va differensiallari

### 21.1. Ko‘p o‘zgaruvchili funksiyaning xususiy hosilalari.

$u = f(M) = f(x_1, x_2, \dots, x_m)$  funksiya ochiq  $\{M\}$  ( $\{M\} \subset R^m$ ) to‘plamda aniqlangan bo‘lsin. Bu to‘plamdan  $M(x_1, x_2, \dots, x_m)$  nuqtani olamiz va funksiyaning  $x_k$  argumentiga  $\Delta x_k$  orttirma beramiz (qolgan argumentlarini o‘zgarmas, deb hisoblaymiz). Natijada, funksiya ham  $\Delta_{x_k} u$  orttirma oladi. Ushbu

$$\frac{\Delta_{x_k} u}{\Delta x_k} = \frac{f(x_1, x_2, \dots, x_{k-1}, x_k + \Delta x_k, x_{k+1}, \dots, x_m) - f(x_1, x_2, \dots, x_m)}{\Delta x_k} \quad (21.1)$$

nisbatni qaraymiz, bunda  $M(x_1, x_2, \dots, x_{k-1}, x_k + \Delta x_k, x_{k+1}, \dots, x_m) \in \{M\}$ .

**21.1-ta’rif.** Agar  $\Delta x_k \rightarrow 0$  da (21.1) nisbatning limiti mavjud va chekli bo‘lsa, bu limit  $f(x_1, x_2, \dots, x_m)$  funksiyaning  $M(x_1, x_2, \dots, x_m)$  nuqtadagi  $x_k$  argumenti bo‘yicha *xususiy hosilasi* deyiladi va

$$\frac{\partial f(x_1, \dots, x_m)}{\partial x_k}, \frac{\partial f}{\partial x_k}, f'_{x_k}(x_1, x_2, \dots, x_m), f'_{x_k}$$

kabi belgilarning biri orqali yoziladi. Ta’rifga ko‘ra,

$$\frac{\partial u}{\partial x_k} = \lim_{\Delta x_k \rightarrow 0} \frac{\Delta_{x_k} u}{\Delta x_k}$$

ko‘rinishda yozish mumkin.

**21.1-misol.** 21.1-ta’rifdan foydalanib, ushbu

$$f(x, y) = 3^{2x+y}$$

funksiyaning  $O(0,0)$  nuqtadagi  $f'_x, f'_y$  xususiy hosilalarini hisoblang.

**Yechilishi.** 21.1-ta’rifga ko‘ra,  $f'_x, f'_y$  xususiy hosilalarini topamiz:

$$\frac{\partial f(0,0)}{\partial x} = \lim_{\Delta x \rightarrow 0} \frac{f(0 + \Delta x, 0) - f(0,0)}{\Delta x} = \lim_{\Delta x \rightarrow 0} \frac{3^{2 \cdot 0 + \Delta x} - 1}{\Delta x} = 2 \ln 3 = \ln 9,$$

$$\frac{\partial f(0,0)}{\partial y} = \lim_{\Delta y \rightarrow 0} \frac{f(0, 0 + \Delta y) - f(0,0)}{\Delta y} = \lim_{\Delta y \rightarrow 0} \frac{3^{2 \cdot 0 + \Delta y} - 1}{\Delta y} = \ln 3.$$

Demak,  $f'_x(0,0) = \ln 9$ ,  $f'_y(0,0) = \ln 3$ .

**21.2-misol.** Ushbu

$$f(x, y) = \sqrt{(x-1)^2 + (y-1)^2}$$

funksiyaning  $A(1, 1)$  nuqtadagi  $f'_x, f'_y$  xususiy hosilalari mavjud emasligini ko‘rsating.

**Yechilishi.** Faraz qilaylik,  $(x, y) \neq (1, 1)$  bo‘lsin, u holda,  $f'_x, f'_y$  xususiy hosilalarni topamiz:

$$f'_x(x, y) = \frac{x-1}{\sqrt{(x-1)^2 + (y-1)^2}}, \quad f'_y(x, y) = \frac{y-1}{\sqrt{(x-1)^2 + (y-1)^2}}.$$

Demak,  $(x, y) \neq (1, 1)$  da berilgan funksiyaning xususiy hosilalari mavjud.

21.1-ta'rifga ko'ra, berilgan funksiyaning  $f'_x(1, 1)$ ,  $f'_y(1, 1)$  xususiy hosilalarini topamiz:

$$\frac{\partial f(1, 1)}{\partial x} = \lim_{\Delta x \rightarrow 0} \frac{f(1 + \Delta x, 1) - f(1, 1)}{\Delta x} = \lim_{\Delta x \rightarrow 0} \frac{|\Delta x|}{\Delta x},$$

$$\frac{\partial f(1, 1)}{\partial y} = \lim_{\Delta y \rightarrow 0} \frac{f(1, 1 + \Delta y) - f(1, 1)}{\Delta y} = \lim_{\Delta y \rightarrow 0} \frac{|\Delta y|}{\Delta y}.$$

Bunda  $\lim_{\Delta x \rightarrow 0} \frac{|\Delta x|}{\Delta x}$ ,  $\lim_{\Delta y \rightarrow 0} \frac{|\Delta y|}{\Delta y}$  limitlar har xil qiymatlarga ega bo'lganligi

uchun, limitlar mavjud emas.

Demak, berilgan funksiyaning  $A(1, 1)$  nuqtada xususiy hosilalari mavjud emas.

### 21.3-misol. Quyidagi:

$$1) f(x, y) = \arcsin \frac{x}{y}; \quad 2) f(x, y, z) = e^{xyz}$$

funksiyalarning xususiy hosilalarini toping.

**Yechilishi.** 1)  $(\arcsin u)' = \frac{u'}{\sqrt{1-u^2}}$  formulaga asosan,  $f'_x(x, y)$  va

$f'_y(x, y)$  xususiy hosilalarni topamiz:

$$\frac{\partial f}{\partial x} = \frac{1}{\sqrt{1-\left(\frac{x}{y}\right)^2}} \cdot \frac{1}{y} = \frac{1}{\sqrt{y^2-x^2}}, \quad \frac{\partial f}{\partial y} = \frac{1}{\sqrt{1-\left(\frac{x}{y}\right)^2}} \cdot \left(-\frac{x}{y^2}\right) = -\frac{xy}{\sqrt{y^2-x^2}}.$$

2)  $(e^u)' = e^u u'$  formulaga asosan, berilgan funksiyaning xususiy hosilalarini topamiz:

$$\frac{\partial u}{\partial x} = e^{xyz} \cdot yz, \quad \frac{\partial u}{\partial y} = e^{xyz} \cdot xz, \quad \frac{\partial u}{\partial z} = e^{xyz} \cdot xy.$$

**21.4-misol.** Ushbu  $u = \frac{1}{2}(x^2 + y^2) + \varphi(x-y)$  funksiya  $\frac{\partial u}{\partial x} + \frac{\partial u}{\partial y} = x+y$

tenglamani qanoatlantiradimi?

**Yechilishi.** Dastlab, berilgan funksiyaning  $\frac{\partial u}{\partial x}$ ,  $\frac{\partial u}{\partial y}$  xususiy hosilalarini topamiz:

$$\frac{\partial u}{\partial x} = x + \varphi'(x-y), \quad \frac{\partial u}{\partial y} = y - \varphi'(x-y).$$

Endi bu xususiy hosilalarni tenglamaga olib borib qo'yamiz:

$$x + \varphi'(x-y) + y - \varphi'(x-y) = x + y \Rightarrow x + y = x + y.$$

Demak,  $u = \frac{1}{2}(x^2 + y^2) + \phi(x - y)$  funksiya birinchi tartibli xususiy hosilali differensial tenglamaning yechimi ekan.

**21.1-eslatma.** Berilgan nuqtada funksiyaning hamma xususiy hosilalarining mavjudligidan, uning shu nuqtada uzliksizligi kelib chiqavermaydi. Masalan,

$$u = \begin{cases} \frac{xy}{x^2 + y^2}, & x^2 + y^2 \neq 0 \text{ bo'lganda,} \\ 0, & x^2 + y^2 = 0 \text{ bo'lganda} \end{cases}$$

funksiya  $M_0(0,0)$  nuqtada uzliksiz emas, lekin bu funksiya ko'rsatilgan nuqtada  $x$  va  $y$  argumentlari bo'yicha xususiy hosilalarga ega:

$$\left. \frac{\partial u}{\partial x} \right|_{(0,0)} = 0; \quad \left. \frac{\partial u}{\partial y} \right|_{(0,0)} = 0,$$

chunki  $f(x,0) = 0$ ,  $f(0,y) = 0$ .

**21.2. Ko'p o'zgaruvchili funksiyaning differensiallanuvchanligi sharti.**  $u = f(M)$  funksiya  $\{M\}$  ( $\{M\} \subset R^m$ ) to'plamda berilgan bo'lsin. Ma'lumki,  $u = f(M)$  funksiyaning  $M(x_1, x_2, \dots, x_m)$  nuqtadagi to'liq orttirmasi:

$$\Delta u = f(x_1 + \Delta x_1, x_2 + \Delta x_2, \dots, x_m + \Delta x_m) - f(x_1, x_2, \dots, x_m)$$

ifodadan iborat (20-§ ga qarang).

**21.2-ta'rif.** Agar  $u = f(M)$  funksiyaning  $M$  nuqtadagi to'liq orttirmasini

$$\Delta u = A_1 \Delta x_1 + A_2 \Delta x_2 + \dots + A_m \Delta x_m + \alpha_2 \Delta x_2 + \dots + \alpha_m \Delta x_m, \quad (21.2)$$

bunda,  $A_1, A_2, \dots, A_m$  lar,  $\Delta x_1, \Delta x_2, \dots, \Delta x_m$  larga bog'liq bo'lgagan o'zgarmaslar,  $\alpha_1, \alpha_2, \dots, \alpha_m$  lar esa,  $\Delta x_1, \Delta x_2, \dots, \Delta x_m$  larga bog'liq va  $\Delta x_1 \rightarrow 0, \Delta x_2 \rightarrow 0, \dots, \Delta x_m \rightarrow 0$  da  $\alpha_1 \rightarrow 0, \alpha_2 \rightarrow 0, \dots, \alpha_m \rightarrow 0$  ( $\Delta x_1 = \Delta x_2 = \dots = \Delta x_m = 0$  bo'lganda esa,  $\alpha_1 = \alpha_2 = \dots = \alpha_m = 0$  deb olinadi), ko'rinishda ifodalash mumkin bo'lsa,  $f(M)$  funksiya  $M(x_1, x_2, \dots, x_m)$  nuqtada differensiallanuvchi deyiladi.

**21.1-teorema.** Agar  $u = f(M) = f(x_1, x_2, \dots, x_m)$  funksiya  $M(x_1, x_2, \dots, x_m)$  nuqtada differensiallanuvchi bo'lsa, bu funksiyaning  $M(x_1, x_2, \dots, x_m)$  nuqtada barcha argumentlari bo'yicha xususiy hosilalari mavjud va  $\frac{\partial u}{\partial x_i} = A_i$  ( $i = 1, 2, \dots, m$ ) bo'ladi, bunda  $A_i$  ( $i = 1, 2, \dots, m$ ) lar (21.2) shartdan topiladi.

**21.1-natija.** (21.2) differensiallanuvchanlik shartini,

$$\Delta u = \frac{\partial u}{\partial x_1} \Delta x_1 + \frac{\partial u}{\partial x_2} \Delta x_2 + \dots + \frac{\partial u}{\partial x_m} \Delta x_m + o(\rho) \quad (21.3)$$

ko‘rinishda yozish mumkin, bunda  $\rho = M(x_1, x_2, \dots, x_m)$  va  $M_1(x_1 + \Delta x_1, x_2 + \Delta x_2, \dots, x_m + \Delta x_m) \in \{M\}$  nuqtalar orasidagi masofa, ya’ni  $\rho = \sqrt{\Delta x_1^2 + \Delta x_2^2 + \dots + \Delta x_m^2}$ .

**21.2-natija.** Agar  $u = f(M)$  funksiya  $M(x_1, x_2, \dots, x_m)$  nuqtada differensialanuvchi bo‘lsa, uning to‘liq orttirmasi (21.2) shaklida tasvirlanishi yagonadir. Agar  $u = f(M)$  funksiya  $M(x_1, x_2, \dots, x_m)$  nuqtada differensialanuvchi bo‘lsa, u shu nuqtada uzluksiz bo‘ladi.

**21.2-teorema.** Agar  $u = f(M)$  funksiya  $M_0(x_1^0, \dots, x_m^0)$  nuqtaning biror atrofida barcha argumentlari bo‘yicha xususiy hosilalarga ega bo‘lib, bu hosilalar  $M_0$  nuqtada uzluksiz bo‘lsa, u holda, berilgan funksiya  $M_0$  nuqtada differensialanuvchi bo‘ladi.

**21.6-misol.** Ushbu  $f(x, y) = \sqrt{xy}$  funksiyaning  $O(0, 0)$  nuqtada xususiy hosilalarga egaligini va u shu nuqtada differensialanuvchi emasligini ko‘rsating.

**Yechilishi.** Ta’rifdan foydalanib, berilgan funksiyaning  $O(0, 0)$  nuqtadagi xususiy hosilalarini topamiz:

$$\begin{aligned}\frac{\partial f(0, 0)}{\partial x} &= \lim_{\Delta x \rightarrow 0} \frac{f(0 + \Delta x, 0) - f(0, 0)}{\Delta x} = \lim_{\Delta x \rightarrow 0} \frac{\sqrt{\Delta x \cdot 0}}{\Delta x} = 0, \\ \frac{\partial f(0, 0)}{\partial y} &= \lim_{\Delta y \rightarrow 0} \frac{f(0, 0 + \Delta y) - f(0, 0)}{\Delta y} = \lim_{\Delta y \rightarrow 0} \frac{\sqrt{0 \cdot \Delta y}}{\Delta y} = 0.\end{aligned}$$

$O(0, 0)$  nuqtada berilgan funksiyaning to‘la orttirmasini topamiz:

$$\Delta f(0, 0) = f(\Delta x, \Delta y) - f(0, 0) = \sqrt{\Delta x \Delta y}. \quad (*)$$

Faraz qilaylik, berilgan funksiya  $O(0, 0)$  nuqtada differensialanuvchi bo‘lsin. U holda, (\*) orttirma ushbu

$$\Delta f(0, 0) = f'_x(0, 0)\Delta x + f'_y(0, 0)\Delta y + o(\rho)$$

ko‘rinishda ifodalanadi, bunda  $\rho = \sqrt{\Delta x^2 + \Delta y^2}$ . Quyidagi limitlarni qaraymiz:

$$\lim_{\substack{\Delta x \rightarrow 0 \\ \Delta y \rightarrow 0}} \frac{\Delta f(0, 0) - f'_x(0, 0)\Delta x - f'_y(0, 0)\Delta y}{\sqrt{\Delta x^2 + \Delta y^2}} = \lim_{\substack{\Delta x \rightarrow 0 \\ \Delta y \rightarrow 0}} \frac{\sqrt{\Delta x \Delta y}}{\sqrt{\Delta x^2 + \Delta y^2}} \neq 0.$$

Agar  $\Delta x = \Delta y \rightarrow 0$  da  $\frac{\sqrt{\Delta x \Delta y}}{\sqrt{\Delta x^2 + \Delta y^2}} = \frac{\sqrt{\Delta x^2}}{|\Delta x| \sqrt{2}} \rightarrow +\infty$ .

Demak, berilgan funksiya  $O(0, 0)$  nuqtada differensialanuvchi emas.

**21.3. Ko‘p o‘zgaruvchili funksiyaning differensiali.**  $u = f(M)$  funksiya  $\{M\}$  ( $\{M\} \subset R^m$ ) to‘plamda berilgan bo‘lib, bu funksiya

$M(x_1, x_2, \dots, x_m) \in \{M\}$  nuqtada differensiallanuvchi bo'lsin. U holda  $u = f(M)$  funksiyaning  $\Delta u$  to'liq orttirmasi uchun (21.2) formula o'rinli:

$$\Delta u = A_1 \Delta x_1 + \dots + A_m \Delta x_m + \alpha_1 \Delta x_1 + \dots + \alpha_m \Delta x_m.$$

**21.3-ta'rif.**  $u = f(M)$  funksiya  $\Delta u$  orttirmasining  $\Delta x_1, \Delta x_2, \dots, \Delta x_m$  larga nisbatan chiziqli bosh qismi,  $u = f(M)$  funksiyaning  $M$  nuqtadagi differensiali (*to'liq differensiali*) deb ataladi va  $y, du, df$  yoki  $df(x_1, x_2, \dots, x_m)$  kabi belgilanadi.

Demak,

$$du = df(x_1, x_2, \dots, x_m) = A_1 \Delta x_1 + A_2 \Delta x_2 + \dots + A_m \Delta x_m \quad (21.4)$$

21.1-teoremani e'tiborga olsak, u holda, (21.4) funksiya differensialini quyidagi,

$$du = \frac{\partial u}{\partial x_1} \Delta x_1 + \frac{\partial u}{\partial x_2} \Delta x_2 + \dots + \frac{\partial u}{\partial x_m} \Delta x_m \quad (21.5)$$

ko'rinishda ham yozish mumkin.  $x_i (i=1,2,\dots,m)$  o'zgaruvchining differensiali  $dx_i (i=1,2,\dots,m)$  deb, ixtiyoriy  $(x_1, x_2, \dots, x_m)$  larga bog'liq bo'lмаган son tushuniladi. Bu sonni, bundan keyin,  $\Delta x_i (i=1,2,\dots,m)$  ga teng deb olishga kelishib olamiz, ya'ni  $dx_i = \Delta x_i (i=1,2,\dots,m)$ . Bu kelishuvni e'tiborga olsak, (21.5) ni quyidagi,

$$du = \frac{\partial u}{\partial x_1} dx_1 + \frac{\partial u}{\partial x_2} dx_2 + \dots + \frac{\partial u}{\partial x_m} dx_m \quad (21.6)$$

ko'rinishda yozish mumkin.

**5.6-misol.** Ushbu  $z = e^{x^2 y^2}$  fuksiyaning  $dz$  birinchi tartibli to'liq differensialini toping.

**Yechilishi.** Berilgan funksiyadan  $x$  va  $y$  o'zgaruvchilar bo'yicha xususiy hosilalarni topamiz:

$$\frac{\partial z}{\partial x} = \left( e^{x^2 y^2} \right)_y = e^{x^2 y^2} 2xy^2, \quad \frac{\partial z}{\partial y} = \left( e^{x^2 y^2} \right)_x = e^{x^2 y^2} 2x^2 y.$$

Topilgan birinchi tartibli xususiy hosilalarni  $dz = z'_x dx + z'_y dy$  formulaga keltirib qo'yamiz

$$dz = e^{x^2 y^2} 2xy^2 dx + e^{x^2 y^2} 2x^2 y dy = e^{x^2 y^2} 2xy(ydx + xdy).$$

**21.7- misol.** Funksiyaning orttirmasini uning differensialiga almashtirib, ushbu (0,98)<sup>2,01</sup> sonni taqribi hisoblang.

**Yechilishi.** Quyidagi  $u = x^y$  funksiyani qaraymiz. Bu funksiyaning (1;2) nuqtadagi qiymati  $u(1;2) = 1$  bo'ladi.  $u = x^y$  funksiyaning (0,98; 2,01) nuqtadagi qiymatini hisoblaymiz.

Dastlab  $u = x^y$  funksiyaning (1;2) nuqtadagi  $u'_x, u'_y$  xususiy hosilalarini topamiz:

$$u_x' = yx^{y-1}, \quad u_x'(1; 2) = 2; \quad u_y' = x^y \ln x, \quad u_y'(1; 2) = 0.$$

Berilgan sonni  $u(x + \Delta x, y + \Delta y) \approx u(x, y) + u_x'(x, y)\Delta x + u_y'(x, y)\Delta y$  formula bo'yicha hisoblaymiz, bunda  $\Delta x = -0,02$ ,  $\Delta y = 0,01$ ,

$$\begin{aligned} (0,98)^{2,01} &= u(1 - 0,02, 2 + 0,01) \approx u(1, 2) + u_x'(1; 2)\Delta x + u_y'(1; 2)\Delta y = \\ &= 1 + 2 \cdot (-0,02) + 0 \cdot 0,01 = 0,96. \end{aligned}$$

**21.4. Ko'p o'zgaruvchili murakkab funksiyaning hosilasi.**  $u = f(M) = f(x_1, x_2, \dots, x_m)$  funksiya  $\{M\}$  ( $\{M\} \subset R^m$ ) to'plamda berilgan bo'lib,  $x_1, x_2, \dots, x_m$  o'zgaruvchilarning har biri, o'z navbatida,  $t_1, t_2, \dots, t_k$  o'zgaruvchilarning funksiyasi sifatida,  $\{N\}$  ( $\{N\} \subset R^k$ ) to'plamda berilgan funksiyalar bo'lsin:

$$\begin{aligned} x_1 &= \varphi_1(t_1, t_2, \dots, t_k), \\ x_2 &= \varphi_2(t_1, t_2, \dots, t_k), \\ \dots & \\ x_m &= \varphi_m(t_1, t_2, \dots, t_k). \end{aligned} \tag{21.7}$$

Bunda,  $(t_1, t_2, \dots, t_m) \in \{N\}$  bo'lganda, unga mos kelgan  $(x_1, x_2, \dots, x_m) \in \{M\}$  bo'lsin, deb faraz qilinadi. Natijada, ushbu

$$u = f(\varphi_1(t_1, t_2, \dots, t_k), \varphi_2(t_1, t_2, \dots, t_k), \dots, \varphi_m(t_1, t_2, \dots, t_k))$$

ko'p o'zgaruvchili murakkab funksiyaga ega bo'lamiz.

**21.3-teorema.** Agar (21.7) fnksiyalarning har biri  $N_i(t_1^0, t_2^0, \dots, t_k^0) \in \{N\}$  nuqtada differensiallanuvchi bo'lib,  $u = f(x_1, x_2, \dots, x_m)$  funksiya esa, unga mos  $M_0(x_1^0, x_2^0, \dots, x_k^0) \in \{M\}$  ( $x_1^0 = \varphi_1(t_1^0, t_2^0, \dots, t_k^0)$ ,  $x_2^0 = \varphi_2(t_1^0, t_2^0, \dots, t_k^0)$ , ...,  $x_m^0 = \varphi_m(t_1^0, t_2^0, \dots, t_k^0)$ ) nuqtada differensiallanuvchi bo'lsa, u holda,  $f(\varphi_1(t_1, t_2, \dots, t_k), \dots, \varphi_m(t_1, t_2, \dots, t_k))$  murakkab funksiya ham  $N_0(t_1^0, t_2^0, \dots, t_k^0)$  nuqtada differensiallanuvchi bo'ladi va uning xususiy hosilalari

$$\begin{aligned} \frac{\partial u}{\partial t_1} &= \frac{\partial u}{\partial x_1} \frac{\partial x_1}{\partial t_1} + \frac{\partial u}{\partial x_2} \frac{\partial x_2}{\partial t_1} + \dots + \frac{\partial u}{\partial x_m} \frac{\partial x_m}{\partial t_1}, \\ \frac{\partial u}{\partial t_2} &= \frac{\partial u}{\partial x_1} \frac{\partial x_1}{\partial t_2} + \frac{\partial u}{\partial x_2} \frac{\partial x_2}{\partial t_2} + \dots + \frac{\partial u}{\partial x_m} \frac{\partial x_m}{\partial t_2}, \\ \dots & \\ \frac{\partial u}{\partial t_k} &= \frac{\partial u}{\partial x_1} \frac{\partial x_1}{\partial t_k} + \frac{\partial u}{\partial x_2} \frac{\partial x_2}{\partial t_k} + \dots + \frac{\partial u}{\partial x_m} \frac{\partial x_m}{\partial t_k}. \end{aligned} \tag{21.8}$$

formulalar orqali topiladi.

**21.4-eslatma.** Xususiy holda, (21.8) dagi funksiyalarning har biri faqat bitta  $t$  ga bog'liq bo'lsa, u holda, biz faqat  $t$  ga bog'liq bo'lgan  $u = f(x_1, x_2, \dots, x_m)$ ,  $x_i = \varphi_i(t)$  ( $i = 1, 2, \dots, k$ ) murakkab funksiyaga ega bo'lamiz. Bu murakkab funksiyaning hosilasi

$$\frac{du}{dt} = \frac{du}{dx_1} \frac{dx_1}{dt} + \frac{du}{dx_2} \frac{dx_2}{dt} + \dots + \frac{du}{dx_m} \frac{dx_m}{dt}$$

formula bo'yicha topiladi.

*Ikki o'zgaruvchili funksiya uchun zanjir qoidasi:* Agar  $W = f(x, y)$  diferensiallanuvchi funksiya,  $x$  va  $y$  lar esa, t erkli o'zgaruvchining diferensiallanuvchi funksiyalari bo'lsa, u holda,  $W$  funksiya ham t erkli o'zgaruvchining diferensiallanuvchi funksiyasi bo'ladi va

$$\frac{dW}{dt} = \frac{\partial W}{\partial x} \frac{dx}{dt} + \frac{\partial W}{\partial y} \frac{dy}{dt}$$

formula o'rinni.

Bu tasdiqning «daraxt diagrammasi» quyidagicha:  
 $\frac{dW}{dt}$  ni topish uchun,  $W$  dan boshlab, har bir yo'l bo'yicha pastga qarab harakat qilinib, yo'lda uchragan hosilalar ko'paytirilib, so'ngra ular qo'shiladi:

$$\frac{dW}{dt} = \frac{\partial W}{\partial x} \frac{dx}{dt} + \frac{\partial W}{\partial y} \frac{dy}{dt}.$$

*Uch o'zgaruvchili murakkab funksiya uchun zanjir qoidasi:* Agar  $W = f(x, y, z)$  diferensiallanuvchi funksiya,  $x$ ,  $y$  va  $z$  lar esa, t erkli o'zgaruvchining diferensiallanuvchi funksiyalari bo'lsa, u holda,  $W$  funksiya ham t erkli o'zgaruvchining diferensiallanuvchi funksiyasi bo'ladi va

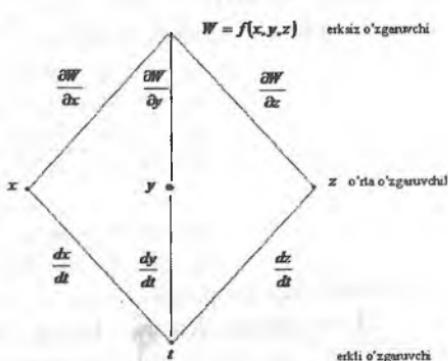

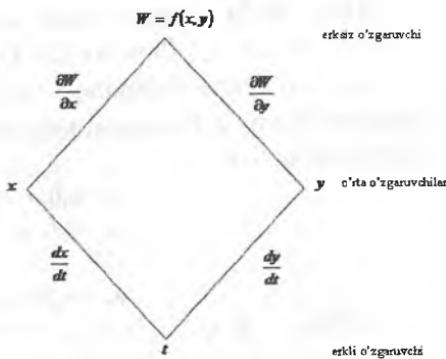

$$\frac{dW}{dt} = \frac{\partial W}{\partial x} \frac{dx}{dt} + \frac{\partial W}{\partial y} \frac{dy}{dt} + \frac{\partial W}{\partial z} \frac{dz}{dt}$$

formula o'rinni.

Bu tasdiqning «daraxt diagrammasi» quyidagicha:  $\frac{dW}{dt}$  ni topish uchun,  $W$  dan boshlab har bir yo'l bo'yicha pastga qarab harakat qilinib, yo'lda uchragan hosilalar ko'paytirilib, so'ngra ular qo'shiladi:

$$\frac{dW}{dt} = \frac{\partial W}{\partial x} \frac{dx}{dt} + \frac{\partial W}{\partial y} \frac{dy}{dt} + \frac{\partial W}{\partial z} \frac{dz}{dt}.$$

*Ikkita erkli o'zgaruvchi va uchta o'rta o'zgaruvchilar uchun zanjir qoidasi:* Agar  $W = f(x, y, z)$   $x = g(r, s)$ ,  $y = h(r, s)$  va  $z = k(r, s)$

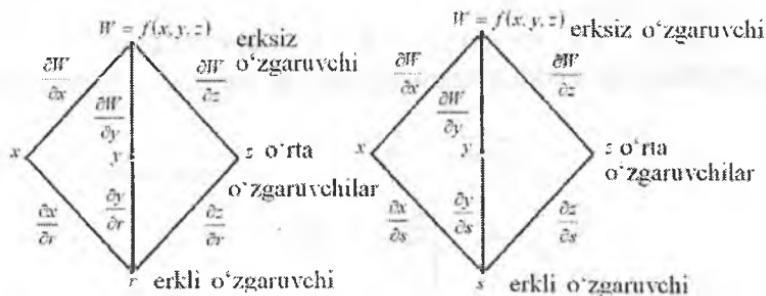

diferensiallanuvchi funksiyalar bo'lsa, u holda,  $w$  funksiya ham  $r$  va  $s$  erkli o'zgaruvchilarga nisbatan xususiy hosilalarga ega bo'ladi va ular uchun,

$$\frac{\partial w}{\partial r} = \frac{\partial W}{\partial x} \frac{\partial x}{\partial r} + \frac{\partial W}{\partial y} \frac{\partial y}{\partial r} + \frac{\partial W}{\partial z} \frac{\partial z}{\partial r}, \quad \frac{\partial w}{\partial s} = \frac{\partial W}{\partial x} \frac{\partial x}{\partial s} + \frac{\partial W}{\partial y} \frac{\partial y}{\partial s} + \frac{\partial W}{\partial z} \frac{\partial z}{\partial s}$$

formulalar o'rinni.

Bu tasdiqning «daraxt diagrammasi» quyidagicha:  $\frac{\partial W}{\partial r}$ ,  $\frac{\partial W}{\partial s}$  ni topish uchun,  $w$  dan boshlab har bir yo'l bo'yicha pastga qarab harakat qilinib, yo'lida uchragan hosilalar ko'paytirilib, so'ngra ular qo'shiladi:

$$\frac{\partial w}{\partial r} = \frac{\partial W}{\partial x} \frac{\partial x}{\partial r} + \frac{\partial W}{\partial y} \frac{\partial y}{\partial r} + \frac{\partial W}{\partial z} \frac{\partial z}{\partial r},$$

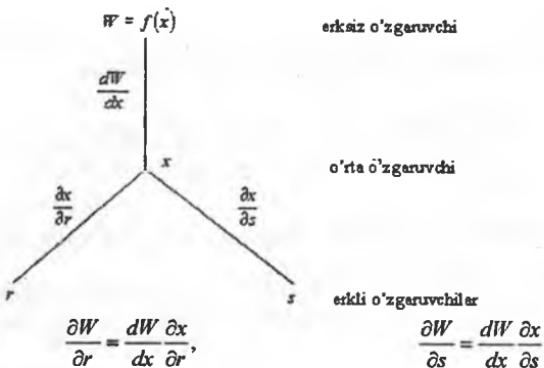

$$\frac{\partial w}{\partial s} = \frac{\partial W}{\partial x} \frac{\partial x}{\partial s} + \frac{\partial W}{\partial y} \frac{\partial y}{\partial s} + \frac{\partial W}{\partial z} \frac{\partial z}{\partial s}.$$

Agar  $w = f(x)$ ,  $x = g(r, s)$  differensiallanuvchi funksiyalar bo'lsa, u holda,  $w$  funksiya ham  $r$  va  $s$  erkli o'zgaruvchilarga nisbatan xususiy hosilalarga ega bo'ladi va ular uchun,

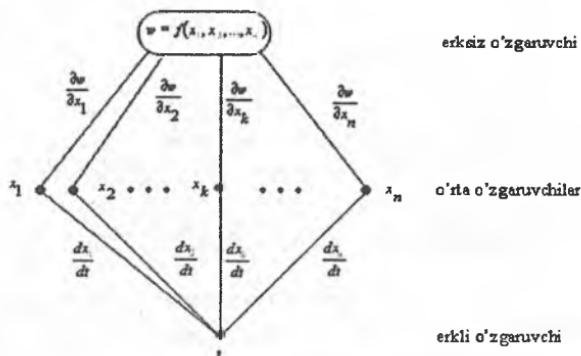

$$\frac{\partial W}{\partial r} = \frac{dW}{dx} \frac{\partial x}{\partial r}, \quad \frac{\partial W}{\partial s} = \frac{dW}{dx} \frac{\partial x}{\partial s}$$

formulalar o'rinni.

Bu tasdiqning "daraxt diagrammasi" quyidagicha:  $\frac{\partial W}{\partial r}$ ,  $\frac{\partial W}{\partial s}$  larni topish uchun,  $w$  dan boshlab harakat qilinib,  $\frac{dW}{dx}$  hosila  $x$  o'rtaliga o'zgaruvchining  $r$  va  $s$  erkli o'zgaruvchilar bo'yicha xususiy hosilalariga ko'paytiriladi:

$w = f(x_1, x_2, \dots, x_n)$ ,  $x_1 = x_1(t), x_2 = x_2(t), \dots, x_n = x_n(t)$  ( $n$  ta o'rta o'zgaruvchilar, bitta erkli o'zgaruvchi holi) bo'lsa, daraxt diagrammasi

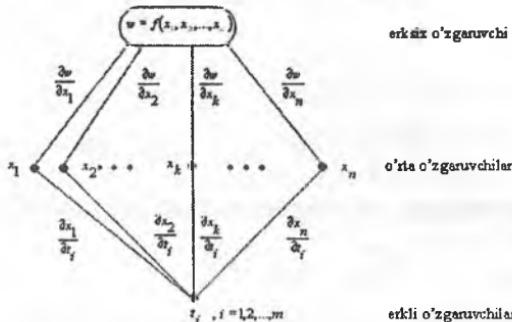

ko'rinishni oladi va  $w$  funksiyaning  $t$  erkli o'zgaruvchi bo'yicha to'liq hosilasi,

$$\frac{dw}{dt} = \frac{\partial f}{\partial x_1} \frac{dx_1}{dt} + \frac{\partial f}{\partial x_2} \frac{dx_2}{dt} + \dots + \frac{\partial f}{\partial x_n} \frac{dx_n}{dt}$$

formula bo'yicha hisoblanadi.

$w = f(x_1, x_2, \dots, x_n)$ ,  $x_1 = \varphi_1(t_1, t_2, \dots, t_m)$ ,  $x_2 = \varphi_2(t_1, t_2, \dots, t_m)$ , ...,  $x_n = \varphi_n(t_1, t_2, \dots, t_m)$  funksiya uchun "daraxt diagrammasi"

ko‘rinishni oladi va  $w$  funksiyaning  $t_i, i=1,2,\dots,m$ , erkli o‘zgaruvchilar bo‘yicha xususiy hosilalari,

$$\frac{\partial w}{\partial t_1} = \frac{\partial f}{\partial x_1} \frac{\partial x_1}{\partial t_1} + \frac{\partial f}{\partial x_2} \frac{\partial x_2}{\partial t_1} + \dots + \frac{\partial f}{\partial x_n} \frac{\partial x_n}{\partial t_1},$$

$$\frac{\partial w}{\partial t_2} = \frac{\partial f}{\partial x_1} \frac{\partial x_1}{\partial t_2} + \frac{\partial f}{\partial x_2} \frac{\partial x_2}{\partial t_2} + \dots + \frac{\partial f}{\partial x_n} \frac{\partial x_n}{\partial t_2},$$

$$\frac{\partial w}{\partial t_m} = \frac{\partial f}{\partial x_1} \frac{\partial x_1}{\partial t_m} + \frac{\partial f}{\partial x_2} \frac{\partial x_2}{\partial t_m} + \dots + \frac{\partial f}{\partial x_n} \frac{\partial x_n}{\partial t_m}$$

formulalar yordamida hisoblanadi.

**21.8-misol.** Ushbu  $W = x^3 - xy, x = 1 - t^2, y = t^4$  murakkab funksiyaning a) zanjir qoidasidan foydalanib; b) bevosita  $t$  bo‘yicha differensialab,  $\frac{dW}{dt}$  ni  $t$  ning funksiyasi sifatida ifodalang, so‘ngra  $\frac{dW}{dt}$  ning berilgan  $t=1$  nuqtadagi qiymatini toping.

**Yechilishi.** a)  $\frac{dW}{dt}$  ni  $\frac{\partial W}{\partial x}$  ni

topish uchun, «daraxt diagrammasi»ga asosan,  $W$  dan boshlab, har bir yo‘l bo‘yicha pastga qarab harakat qilib, yo‘lda uchragan hosilalarni ko‘paytiramiz, so‘ngra ularni qo‘shamiz:

$$\frac{dW}{dt} = \frac{\partial W}{\partial x} \frac{dx}{dt} + \frac{\partial W}{\partial y} \frac{dy}{dt} = (3 - 6t^2 + 2t^4)(-2t) + (t^2 - 1)4t^3 = 2t(4t^2 - 3)$$

Murakkab funksiyaning  $\frac{dW}{dt}$  hosilasini  $\frac{dW}{dt} = \frac{\partial W}{\partial x} \frac{dx}{dt} + \frac{\partial W}{\partial y} \frac{dy}{dt}$  formula

bo'yicha topamiz:

$$\frac{\partial W}{\partial x} = 3x^2 - y = 3(1-t^2)^2 - t^4 = 3 - 6t^2 + 2t^4, \quad \frac{\partial W}{\partial y} = -x = t^2 - 1, \quad \frac{dx}{dt} = -2t, \quad \frac{dy}{dt} = 4t^3,$$

$$\frac{dW}{dt} = \frac{\partial W}{\partial x} \frac{dx}{dt} + \frac{\partial W}{\partial y} \frac{dy}{dt} = (3 - 6t^2 + 2t^4)(-2t) + (t^2 - 1)4t^3 = 2t(4t^2 - 3)$$

Endi,  $\frac{dW}{dt}$  ning berilgan  $t=1$  nuqtadagi qiymatini topamiz:

$$\left. \frac{dW}{dt} \right|_{t=1} = 2t(4t^2 - 3)|_{t=1} = 2.$$

**21.9-misol.** Ushbu  $z = e^x y^2$ ,  $x = u^2 - v^2$ ,  $y = u \cdot v$  murakkab funksiyaning xususiy hosilasini toping.

**Yechilishi.**  $z(x(u,v), y(u,v))$  murakkab funksiyaning xususiy hosilasini topish formulasidan foydalananamiz:

$$\begin{aligned} \frac{\partial z}{\partial x} &= e^x y^2, & \frac{\partial x}{\partial u} &= 2u, & \frac{\partial x}{\partial v} &= -2v, & \frac{\partial x}{\partial y} &= 2ye^x, & \frac{\partial y}{\partial u} &= v, & \frac{\partial y}{\partial v} &= u, \\ \frac{\partial z}{\partial u} &= \frac{\partial z}{\partial x} \cdot \frac{\partial x}{\partial u} + \frac{\partial z}{\partial y} \cdot \frac{\partial y}{\partial u} = e^x y^2 \cdot 2u + 2ye^x \cdot v = 2e^{u^2-v^2} \cdot u^3 v^2 + 2uv^2 e^{u^2-v^2} = \\ &= 2uv^2(u^2+1)e^{u^2-v^2}, \end{aligned}$$

$$\begin{aligned} \frac{\partial z}{\partial v} &= \frac{\partial z}{\partial x} \cdot \frac{\partial x}{\partial v} + \frac{\partial z}{\partial y} \cdot \frac{\partial y}{\partial v} = e^x y^2 \cdot (-2v) + 2ye^x \cdot u = 2e^x y(u-vy) = 2e^{u^2-v^2} \cdot uv(u-v^2u) = \\ &= 2e^{u^2-v^2} u^2 v(1-v^2). \end{aligned}$$

$u = f(x_1, x_2, \dots, x_m)$  funksiya  $\{M\} \subset R^m$  to'plamda berilgan bo'lsin.

**21.4- ta'rif.** Agar  $\{M\}$  ( $\{M\} \subset R^m$ ) to'plamning har bir nuqtasida va 'har bir  $t$  lar uchun

$$f(tx_1, tx_2, \dots, tx_m) = t^p f(x_1, x_2, \dots, x_m) \quad (21.9)$$

tenglik bajarilsa,  $u = f(x_1, x_2, \dots, x_m)$  funksiya  $\{M\}$  ( $\{M\} \subset R^m$ ) to'plamda  $p$ -darajali birjinsli funksiya deyiladi.

**21.4-teorema (birjinsli funksiyalar haqida Eyler teoremasi).** Agar  $u = f(x_1, x_2, \dots, x_m)$  funksiya  $\{M\}$  to'plamda differensiallanuvchi  $p$ -darajali birjinsli funksiya bo'lsa, u holda  $\{M\}$  to'plamning har bir  $M(x_1, x_2, \dots, x_m)$  nuqtasida  $\frac{\partial u}{\partial x_1} x_1 + \frac{\partial u}{\partial x_2} + \dots + \frac{\partial u}{\partial x_m} x_m = pu$  tenglik o'rinli.

**21.10-misol.** Agar  $f(x, y, z)$  funksiya  $\{M\}$  to'plamda differensiallanuvchi  $p$ -darajali birjinsli funksiya bo'lsa,  $f_x(x, y, z)$ ,  $f_y(x, y, z)$ ,  $f_z(x, y, z)$  xususiy hosilalari  $p-1$ -darajali birjinsli funksiyalar ekanligini isbotlang.

**Yechilishi.** Shartga ko'ra,

$$f(tx, ty, tz) = t^p f(x, y, z)$$

bo‘lib, tenglikning chap tomoni differensiallanuvchi. Tenglikni  $x$  bo‘yicha differensiallaymiz:

$$f_x(tx, ty, tz) = t^p f_x(x, y, z) \text{ yoki } f_x(tx, ty, tz) = t^{p-1} f_x(x, y, z).$$

Bundan  $f_x(x, y, z)$  funksiya  $p-1$ - darajali birjinsli funksiya ekanligi kelib chiqadi.  $f_y(x, y, z)$  va  $f_z(x, y, z)$  funksiyalarining ham  $p-1$ - darajali birjinsli funksiya ekanligi xudi yuqoridagidek ko‘rsatiladi.

### 21.5. Differential shakli invariantligning saqlanishi.

$u = f(M) = f(x_1, x_2, \dots, x_m)$  funksiya  $\{M\}$  ( $\{M\} \subset R^m$ ) to‘plamda berilgan bo‘lsin. Biz yuqorida ko‘rgan edikki, agar  $x_1, \dots, x_m$  argumentlar erkli o‘zgaruvchilar bo‘lsa, funksiyaning differensiali (to‘liq differensiali)

$$du = \frac{\partial u}{\partial x_1} dx_1 + \frac{\partial u}{\partial x_2} dx_2 + \dots + \frac{\partial u}{\partial x_m} dx_m \quad (21.10)$$

ko‘rinishda tasvirlanadi. Endi  $x_1, x_2, \dots, x_m$  argumentlar erksiz o‘zgaruvchili, ya’ni biror  $N_0(t_1^0, t_2^0, \dots, t_k^0) \in \{N\}$  nuqtada, differensiallanuvchi  $x_i = \varphi_i(t_1, t_2, \dots, t_k)$  ( $i = 1, 2, \dots, m$ ) funksiyalar,  $u = f(x_1, x_2, \dots, x_m)$  funksiya esa,  $M_0(x_1^0, x_2^0, \dots, x_m^0)$  nuqtada differensiallanuvchi bo‘lsin, deb faraz qilaylik. Bu holda,  $u = f(x_1, x_2, \dots, x_m)$  funksiyani,  $t_1, t_2, \dots, t_k$  o‘zgaruvchilarning murakkab funksiyasi deb qaraymiz. 21.3-teoremaga asosan, bu murakkab funksiya  $N_0$  nuqtada differensiallanuvchi bo‘ladi va uning differensiali,

$$du = \frac{\partial u}{\partial t_1} dt_1 + \frac{\partial u}{\partial t_2} dt_2 + \dots + \frac{\partial u}{\partial t_m} dt_m \quad (21.11)$$

ko‘rinishda tasvirlanadi, bunda  $\frac{\partial u}{\partial t_i}$  lar (21.8) formulalar orqali topiladi.

$\frac{\partial u}{\partial t_i}$  larning ifodalarini (21.8) dan (21.11) ga keltirib qo‘yib va  $\frac{\partial u}{\partial x_i}$  larning koeffisientlarini jamlab, natijada

$$du = \frac{\partial u}{\partial x_1} \left( \frac{\partial x_1}{\partial t_1} dt_1 + \frac{\partial x_1}{\partial t_2} dt_2 + \dots + \frac{\partial x_1}{\partial t_k} dt_k \right) + \dots + \frac{\partial u}{\partial x_m} \left( \frac{\partial x_m}{\partial t_1} dt_1 + \frac{\partial x_m}{\partial t_2} dt_2 + \dots + \frac{\partial x_m}{\partial t_k} dt_k \right) \quad (21.12)$$

munosabatni hosil qilamiz. Ma’lumki,  $\frac{\partial u}{\partial x_i}$  ( $i = 1, 2, \dots, m$ ) ning koeffitsiyenti,

$x_i = \varphi_i(t_1, t_2, \dots, t_k)$  ( $i = 1, 2, \dots, m$ ) funksiyaning  $dx_i$  ( $i = 1, 2, \dots, m$ ) differensialini ifodalaydi. Shuning uchun, (21.12) ning ko‘rinishini, (21.11) ko‘rinishda yozish mumkin. Demak,  $x_1, x_2, \dots, x_m$  lar erksiz o‘zgaruvchilar bo‘lganda ham,  $u = f(x_1, x_2, \dots, x_m)$  funksiyaning differensiali (21.11) ko‘rinishda bo‘lar ekan, ya’ni ko‘p o‘zgaruvchili murakkab funksiyaning birinchi tartibli differensiali shakli invariantligi (ko‘rinishi) saqlanar ekan.

$u = f(M)$  va  $v = g(M)$  funksiyalar ochiq  $\{M\}$  ( $\{M\} \subset R^n$ ) to‘plamda berilgan bo‘lib,  $\{M\}$  to‘plamda differensiallanuvchi bo‘lsa, u holda,  $u \pm v, uv, \frac{u}{v}$  ( $v \neq 0$ ) funksiyalar ham shu  $M$  nuqtada differensiallanuvchi va ularning differensiali uchun, quyidagi,

$$d(cu) = cdu \quad (c = \text{const})$$

$$d(u \pm v) = du \pm dv,$$

$$d(uv) = udv + vdu,$$

$$d\left(\frac{u}{v}\right) = \frac{vdu - udv}{v^2}$$

formulalar o‘rinli bo‘ladi.

**: 21.6. Yo‘nalish bo‘yicha hosila. Gradient.** Ma’lumki, bir o‘zgaruvchili  $y = f(x)$  ( $x \in R, y \in R$ ) funksiyaning  $\frac{\partial f}{\partial x}$  hosilasi, berilgan funksiyaning o‘zgarish tezligini bildiradi. Ko‘p o‘zgaruvchili  $u = f(x_1, x_2, \dots, x_n) = f(M)$  ( $(x_1, x_2, \dots, x_n) \in R^n, u \in R$ ) funksiyaning xususiy hosilalari ham bir o‘zgaruvchili funksiyaning hosilasi kabi ekanligini e’tiborga olib,  $\frac{\partial f}{\partial x_1}, \frac{\partial f}{\partial x_2}, \dots, \frac{\partial f}{\partial x_n}$  funksiyalar ham,  $u = f(x_1, x_2, \dots, x_n)$  funksiyaning, mos ravishda,  $ox_1, ox_2, \dots, ox_n$  o‘qlar bo‘yicha  $R^n$  da o‘zgarish tezligini ifodalaydi, deb qarash mumkin.

Endi ko‘p o‘zgaruvchili funksiyaning ixtiyoriy yo‘nalish bo‘yicha o‘zgarish tezligini ifodalovchi tushuncha bilan tanishamiz. Soddalik uchun, uch o‘zgaruvchili funksiyani qaraymiz.  $u = f(x, y, z) = f(M)$  funksiya ochiq  $\{M\} \subset R^3$  to‘plamda berilgan bo‘lsin.  $\vec{r} = \vec{r}(\cos \alpha, \cos \beta, \cos \gamma)$  birlik vektor bilan aniqlanadigan biror  $\vec{r}$  yo‘nalishni qaraylik.  $\{M\}$  to‘plamda ixtiyoriy  $M_0(x_0, y_0, z_0)$  nuqtani olib, bu nuqta orqali o‘tuvchi, yo‘nalishi,  $\vec{r} = \vec{r}(\cos \alpha, \cos \beta, \cos \gamma)$  vektor yo‘nalishiga mos kelgan  $\vec{r}$  yo‘nalishni qaraylik.  $\vec{r}$  yo‘nalishda  $M_0(x_0, y_0, z_0)$  nuqtaga yaqin yotgan ixtiyoriy o‘zgaruvchi  $M(x, y, z)$  nuqtani olamiz ( $M \in \{M\}$ ).  $M_0 M$  yo‘nalgan kesma  $\{M\} \subset R^3$  to‘plamga tegishli, u holda,

$$\frac{x - x_0}{\rho(M_0, M)} = \cos \alpha, \quad \frac{y - y_0}{\rho(M_0, M)} = \cos \beta, \quad \frac{z - z_0}{\rho(M_0, M)} = \cos \gamma \quad (21.13)$$

bo‘ladi.

**21.5-ta’rif.** Agar  $M(x, y, z)$  nuqta  $\vec{r}$  yo‘nalgan to‘g‘ri chiziq bo‘ylab  $M_0(x_0, y_0, z_0)$  nuqtaga intilganda ( $M \rightarrow M_0$ ), ushbu

$$\frac{f(M) - f(M_0)}{\rho(M_0, M)} = \frac{f(x, y, z) - f(x_0, y_0, z_0)}{\rho((x_0, y_0, z_0), (x, y, z))}$$

nisbatning limiti mayjud bo'lsa, bu limitga  $f(x, y, z) = f(M)$  funksiyaning  $M_0(x_0, y_0, z_0)$  nuqtada  $\vec{i}$  yo'naliш bo'yicha hosilasi deb ataladi va u  $\frac{\partial f(M_0)}{\partial \vec{i}}$  yoki  $\frac{\partial f(x_0, y_0, z_0)}{\partial \vec{i}}$  kabi belgilanadi.

21.5-ta'rifga ko'ra, uni

$$\frac{\partial f}{\partial \vec{i}} = \lim_{M \rightarrow M_0} \frac{f(M) - f(M_0)}{\rho(M_0, M)}.$$

ko'rinishda yozish mumkin.

**21.6-teorema.** Agar  $u = f(x, y, z) = f(M)$  funksiya ochiq  $\{M\} \subset R^3$  to'plamda berilgan bo'lib, u  $M_0(x_0, y_0, z_0) \in \{M\}$  nuqtada differentsiallanuvchi bo'lsa, u holda,  $u = f(x, y, z) = f(M)$  funksiya shu nuqtada har qanday  $\vec{i}$  yo'naliш bo'yicha hosilaga ega bo'ladi va bu hosila,

$$\begin{aligned} \frac{\partial u(M_0)}{\partial \vec{i}} &= \frac{\partial f(x_0, y_0, z_0)}{\partial \vec{i}} = \frac{\partial f(x_0, y_0, z_0)}{\partial x} \cos \alpha + \frac{\partial f(x_0, y_0, z_0)}{\partial y} \cos \beta + \\ &+ \frac{\partial f(x_0, y_0, z_0)}{\partial z} \cos \gamma \end{aligned} \quad (21.14)$$

formula orqali topiladi.

**21.11-misol.** Ushbu  $f(x, y) = \operatorname{arctg} \frac{x}{y}$  funksiyaning  $O(0,0)$  nuqtadan  $M_0(1,1)$  nuqtaga qarab yo'naligan  $\vec{i}$  yo'naliш bo'yicha hosilasini toping.

**Yechilishi.**  $\vec{i}$  birinchi kvadratning  $M_0(1,1)$  nuqtasidan o'tuvchi va  $O(0,0)$  nuqtadan  $M_0(1,1)$  nuqtaga qarab yo'naligan bissektrisadan iborat bo'ladi. (21.13) formulaga asosan,  $\varphi = \frac{\pi}{4}$ . Berilgan funksiya  $M_0(1,1)$  nuqtada differentsiallanuvchi bo'lgani uchun, uning yo'naliш bo'yicha hosilasini (21.14) formula bo'yicha topamiz:

$$\frac{\partial f(x, y)}{\partial \vec{i}} = \frac{\partial f(x, y)}{\partial x} \cos \frac{\pi}{4} + \frac{\partial f(x, y)}{\partial y} \cos \frac{\pi}{4} = \left( \frac{y}{x^2 + y^2} - \frac{x}{x^2 + y^2} \right) \frac{\sqrt{2}}{2}$$

Demak,  $\frac{\partial f(1,1)}{\partial \vec{i}} = 0$ .

**21.12- misol.** Ushbu  $f(x, y) = \sqrt{x^2 + y^2}$  funksiyaning  $M_0(0,0)$  nuqtada ixtiyoriy  $\vec{i}$  yo'naliш bo'yicha hosilasi  $\frac{\partial f(0,0)}{\partial \vec{i}} = 1$  ekanligini ko'rsating.

**Yechilishi.** Quyidagi nisbatni tuzamiz:

$$\frac{f(M) - f(M_0)}{\rho(M_0, M)} = \frac{\sqrt{x^2 + y^2}}{\rho} = \frac{\rho}{\rho} = 1,$$

bundan,

$$\frac{\partial f(0,0)}{\partial \vec{l}} = \lim_{\rho \rightarrow 0} \frac{f(M) - f(M_0)}{\rho(M_0, M)} = 1.$$

**21.13- misol.** Ushbu  $f(x,y) = x + |y|$  funksiyaning  $M_0(0,0)$  nuqtada  $Ox$  va  $Oy$  koordinatalar o‘qlari bo‘yicha hosilasi mavjudmi?

**Yechilishi.** Berilgan  $f(x,y) = x + |y|$  funksiyaning  $M_0(0,0)$  nuqtada  $Ox$  koordinatalar o‘qi bo‘yicha hosilasi 1 ga teng bo‘lib,  $Oy$  koordinatalar o‘qi bo‘yicha hosilasi mavjud emas.

**21.4-eslatma.** Funksiya biror nuqtada differensiallanuvchi bo‘lmasa ham, u shu nuqtada biror yo‘nalish bo‘yicha va hatto har qanday yo‘nalish bo‘yicha hosilaga ega bo‘lishi ham mumkin. Masalan, ushbu  $f(x,y) = \sqrt{x^2 + y^2}$  funksiya  $M_0(0,0)$  nuqtada differensiallanuvchi emas, lekin biz yuqorida ko‘rdikki, bu funksiya  $M_0(0,0)$  nuqtada ixtiyoriy yo‘nalish bo‘yicha hosilaga ega.

**21.7- ta’rif.** Komponentalari (koordinatalari)  $\frac{\partial u}{\partial x}, \frac{\partial u}{\partial y}, \frac{\partial u}{\partial z}$  bo‘lgan vektor,  $u = f(x,y,z)$  funksiyaning  $M_0(x_0, y_0, z_0)$  nuqtadagi gradienti, deb ataladi va u

$$gradu(M_0) = \frac{\partial u(M_0)}{\partial x} \vec{i} + \frac{\partial u(M_0)}{\partial y} \vec{j} + \frac{\partial u(M_0)}{\partial z} \vec{k} \quad (21.15)$$

kabi belgilanadi, bunda  $\frac{\partial u}{\partial x}, \frac{\partial u}{\partial y}, \frac{\partial u}{\partial z}$  xususiy hosilalar  $M_0(x_0, y_0, z_0)$  nuqtada hisoblangan.  $\vec{r} = \vec{r}(\cos \alpha, \cos \beta, \cos \gamma)$  ekanligini e’tiborga olsak, u holda (21.14) ni, ushbu  $\frac{\partial u}{\partial l} = (\vec{r}, gradu)$  (21.14) ko‘rinishda yozish mumkin.

$$|gradu| = \sqrt{\left(\frac{\partial u}{\partial x}\right)^2 + \left(\frac{\partial u}{\partial y}\right)^2 + \left(\frac{\partial u}{\partial z}\right)^2} \quad (21.16)$$

ekanligini hisobga olib, (21.15) formulani,

$$\frac{\partial u}{\partial l} = |\vec{r}| \cdot |gradu| \cdot \cos \varphi$$

ko‘rinishda ham yozish mumkin, bunda  $\varphi = \vec{r}$  bilan gradientning orasidagi burchak.  $|\vec{r}| = 1$  bo‘lgani uchun,

$$\frac{\partial u}{\partial l} = |gradu| \cdot \cos \varphi.$$

Bu formuladan ko‘rinadiki, yo‘nalish bo‘yicha hosila o‘zining maksimum  $\left(\frac{\partial u}{\partial \vec{l}}\right)_{\max}$  qiymatiga  $\cos\varphi = 1$  bo‘lganda, ya’ni  $\vec{v}$  vektorning yo‘nalishi gradientning yo‘nalishiga mos tushganda erishadi,  $\left(\frac{\partial u}{\partial \vec{l}}\right)_{\max} = |\text{grad } u|$ . Agar  $\vec{r}$  ning yo‘nalishi gradientga perpendikulyar yo‘nalgan bo‘lsa,  $\frac{\partial u}{\partial \vec{l}} = 0$  bo‘ladi, chunki  $\varphi = \frac{\pi}{2}$ ,  $\cos \frac{\pi}{2} = 0$ .

**21.14- misol.** Ushbu  $u = x^2 + y^2 + z^2$  skalar funksiyaning  $P(1, 1, 1)$  va  $Q(-1, -1, 1)$  nuqtalardagi gradientlari orasidagi burchakni toping.

**Yechilishi.** Dastlab, berilgan funksiyaning  $P(1, 1, 1)$  va  $Q(-1, -1, 1)$  nuqtalardagi xususiy hosilalarini topamiz:

$$\frac{\partial u}{\partial x} = 2x, \quad \left.\frac{\partial u}{\partial x}\right|_P = 2, \quad \left.\frac{\partial u}{\partial x}\right|_Q = 2,$$

$$\frac{\partial u}{\partial y} = 2y, \quad \left.\frac{\partial u}{\partial y}\right|_P = 2, \quad \left.\frac{\partial u}{\partial y}\right|_Q = -2,$$

$$\frac{\partial u}{\partial z} = 2z, \quad \left.\frac{\partial u}{\partial z}\right|_P = 2, \quad \left.\frac{\partial u}{\partial z}\right|_Q = 2.$$

(21.15), (21.16) formulalarga asosan,  $u = x^2 + y^2 + z^2$  skalar funksiya uchun  $\text{grad } u(P)$ ,  $\text{grad } u(Q)$  hamda  $|\text{grad } u(P)|$ ,  $|\text{grad } u(Q)|$  larni hisoblaymiz:

$$\text{grad } u(P) = 2\vec{i} + 2\vec{j} + 2\vec{k}, \quad \text{grad } u(Q) = 2\vec{i} - 2\vec{j} + 2\vec{k},$$

$$|\text{grad } u(P)| = 2\sqrt{3}, \quad |\text{grad } u(Q)| = 2\sqrt{3}.$$

Endi gradientlar orasidagi burchakni topamiz:

$$\cos\varphi = \frac{\text{grad } u(P)\text{grad } u(Q)}{|\text{grad } u(P)||\text{grad } u(Q)|} = \frac{2 \cdot 2 + 2 \cdot (-2) + 2 \cdot 2}{2\sqrt{3} \cdot 2\sqrt{3}} = \frac{1}{3}.$$

Demak, berilgan  $u$  skalyar funksiyaning  $P(1, 1, 1)$  va  $Q(-1, -1, 1)$  nuqtalardagi gradientlari orasidagi burchak  $\varphi = \arccos \frac{1}{3}$ .

### Mustaqil yechish uchun misollar

Quyidagi funksiyalarning xususiy hosilalarini toping:

**21.1.**  $u = x^2 + y^2 + 3x^2y^3$ .

**21.2.**  $u = \frac{x(x-y)}{y^2}$ .

**21.3.**  $u = xyz + \frac{x}{yz}$ .

**21.4.**  $u = \sin(xy + yz)$ .

**21.5.**  $u = \operatorname{tg}(x+y) \cdot e^{xy}$ .

**21.6.**  $u = \sin \frac{x}{y} \cdot \cos \frac{y}{x}$ .

$$21.7. u = e^x(\cos y + x \sin y).$$

$$21.9. u = \left(\frac{y}{x}\right)^x.$$

$$21.11. u = \arcsin \sqrt{\frac{x^2 - y^2}{x^2 + y^2}}.$$

$$21.13. u = x^y y^z z^x.$$

$$21.21. f(R_1, R_2, R_3) = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3}.$$

Quyidagi funksiyalarning berilgan nuqtadagi xususiy hosilalarini toping:

$$21.17. u = \frac{x}{y^2}, (1;1).$$

$$21.18. u = \ln\left(1 + \frac{x}{y}\right), (1;2).$$

$$21.19. u = xy e^{\sin xy}, (1;1).$$

$$21.20. u = (2x+y)^{2x+y}, (1;-1).$$

21.21. Ushbu  $u = \sqrt[3]{xy}$  funksiyaning  $O(0; 0)$  nuqtadagi xususiy hosilalarini toping. Bu funksiya  $O(0; 0)$  nuqtada differensiallanuvchi bo'ladimi?

Quyidagi berilgan  $u(x, y)$  funksiyalar  $O(0; 0)$  nuqtada xususiy hosilalarga egami;  $O(0; 0)$  nuqtada differensiallanuvchi bo'ladimi?

$$21.22. u = \sqrt{x^2 + y^4}.$$

$$21.23. u = \sqrt{x^4 + y^4}.$$

$$21.24. u = \sqrt[3]{xy}$$

$$21.25. u = \sqrt[3]{x^2 y^2}.$$

$$21.26. u = \begin{cases} e^{\frac{1}{x^2+y^2}}, & x^2 + y^2 \neq 0 \text{ bo'lganda,} \\ 0, & x^2 + y^2 = 0 \text{ bo'lganda.} \end{cases}$$

$$21.27. u = \begin{cases} \frac{x^4 + y^4}{x^2 + y^2}, & x^2 + y^2 \neq 0 \text{ bo'lganda,} \\ 0, & x^2 + y^2 = 0 \text{ bo'lganda.} \end{cases}$$

21.28.  $u(x, y)$  funksiya:

$$a) u = \frac{x}{\sqrt{x^2 + y^2}};$$

$$b) u = \ln(x^2 + xy + y^2)$$

ko'rinishlarda bo'lganda,  $\frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y}$  ifodani hisoblang.

21.29.  $u(x, y, z)$  funksiya:

$$a) u = (x-y)(y-z)(z-x);$$

$$b) u = x + \frac{x-y}{y-z}$$

ko'rinishlarda bo'lganda,  $\frac{\partial u}{\partial x} + \frac{\partial u}{\partial y} + \frac{\partial u}{\partial z}$  ifodani hisoblang.

21.30-21.35- misollarda  $u = f(x_1, x_2, \dots, x_n)$  funksiya uchun quyidagi tasdiqlarning qaysi biri to'g'ri, qaysi biri noto'g'ri?

**21.30.**  $f(x_1, x_2, \dots, x_n)$  funksiya biror nuqtada hamma argumentlari bo'yicha xususiy hosilalarga ega bo'lsa, u shu nuqtada uzlusiz bo'ladi.

**21.31.** Agar funksiya  $R''$  fazoning har bir nuqtasida hamma argumentlari bo'yicha xususiy hosilalarga ega bo'lsa, u  $R''$  da uzlusiz bo'ladi.

**21.32.** Agar funksiya biror nuqtada differentiallanuvchi bo'lsa, u shu nuqtada hamma argumentlari bo'yicha xususiy hosilalarga ega bo'ladi.

**21.33.** Agar funksiyaning biror nuqtada hamma argumentlari bo'yicha xususiy hosilalari mavjud bo'lsa, u shu nuqtada differentiallanuvchi bo'ladi.

**21.34.** Agar funksiya biror nuqtada differentiallanuvchi bo'lsa, u holda, shu nuqtada funksiyaning hamma argumentlari bo'yicha uzlusiz xususiy hosilalari mavjud bo'ladi.

**21.35.** Agar funksiyaning biror nuqtada uzlusiz xususiy hosilalari mavjud bo'lsa, u holda, funksiya shu nuqtada differentiallanuvchi bo'ladi.

**21.36.** Agar  $f(x, y) - xOy$  tekislikdagi  $G$  ochiq sohada aniqlangan, uning  $f_x$  va  $f_y$  xususiy hosilalari  $G$  da chegaralangan bo'lsa, u holda,  $f(x, y)$  funksiyasining  $G$  da uzlusizligini isbotlang.

Quyidagi berilgan funksiyalarning differentialini toping:

$$21.37. \quad u = 2x^4 - 3x^2y^2 + x^3y.$$

$$21.38. \quad u = (y^3 + 2x^2 + 3)^4.$$

$$21.39. \quad u = \frac{y}{x} + \frac{x}{y}.$$

$$21.40. \quad u = -\frac{x}{\sqrt{x^2 + y^2}}.$$

$$21.41. \quad u = a^{\frac{x}{y}}.$$

$$21.42. \quad u = \ln(x + \sqrt{x^2 + y^2}).$$

$$21.43. \quad u = \ln \sin \frac{x+1}{\sqrt{y}}.$$

$$21.44. \quad u = \operatorname{arctg} \frac{x+y}{x-y}.$$

$$21.45. \quad u = (1+xy)^y.$$

Quyidagi funksiyalarning berilgan nuqtalardagi differentialini toping:

$$21.46. \quad u = \frac{x^2 - y^2}{x^2 + y^2}, \quad a) (1;1); \quad b) (0;1). \quad 21.47. \quad u = \sqrt{xy + \frac{x}{y}}, \quad (2;1).$$

$$21.48. \quad u = \cos(xy + xz), \quad M(x, y, z) \text{ va } N\left(t; \frac{\pi}{6}; \frac{\pi}{6}\right) \text{ nuqtalarda.}$$

$$21.49. \quad u = e^{xy} \cdot M(x, y) \text{ va } O(0,0) \text{ nuqtada.}$$

$$21.50. \quad u = x^y, \quad M(x, y) \text{ va } M_o(2; 3) \text{ nuqtalarda.}$$

$$21.51. \quad u = x \ln(xy), \quad M(x, y) \text{ va } M_o(-1; -1) \text{ nuqtalarda.}$$

$$21.52. u = \frac{x}{x^2 + y^2 + z^2}, \quad M(1, 0, 1) . \quad 21.53. u = \operatorname{arctg} \frac{xy}{z^2}, \quad M(3, 2, 1) .$$

$$21.54. u = \left( xy + \frac{x}{y} \right)^z, \quad M(1, 1, 1).$$

Quyidagi berilgan  $f(u)$  funksiyani differensiallanuvchi va uning  $f_u$  hosilalani aniq deb faraz qilib,  $f(u)$  funksiya funksiya uchun  $f_x$ ,  $f_y$  xususiy hosilalarni toping:

$$21.55. u = x^2 + e^y .$$

$$21.56. u = \sqrt[3]{x^3 + xy^2} .$$

$$21.57. u = \operatorname{arctg}(x + \ln y).$$

Quyidagi berilgan  $f(u)$ ,  $f(u, v)$ ,  $f(u, v, w)$  funksiyalarini differensiallanuvchi va ularning  $f_u$ ,  $f_v$ ,  $f_w$  xususiy hosilalari aniq deb faraz qilib, quyidagi  $\varphi$  funksiyaning differensialini toping:

$$21.58. \varphi = f(u), \quad u = xy + \frac{y^2}{x}.$$

$$21.59. 2) \varphi = f(u, v), \quad u = \frac{y}{x+y}, \quad v = x^2 - y^3.$$

$$21.60. \varphi = f(u, v, w), \quad u = x^2 + y^2 + z^2, \quad v = x + y + z, \quad w = xyz.$$

21.61. Agar  $W = \sin(xy + \pi)$ ,  $x = e^t$  va  $y = \ln(t+1)$  bo'lsa,  $t = 0$  da  $\frac{dw}{dt}$  hosilani hisoblang.

21.66. Agar  $W = \sin(2x - y)$ ,  $x = r + \sin s$ ,  $y = rs$  bo'lsa,  $r = \pi$  va  $s = 0$  bo'lganda, mos ravishda,  $\frac{\partial w}{\partial t}$  va  $\frac{\partial w}{\partial s}$  xususiy hosilalarni toping.

21.67. Ushbu  $W(x, y, z) = xy + yz + xz$  funksiyaning  $x = \cos t$ ,  $y = \sin t$ ,  $z = \cos 2t$  egri chiziqdagi  $t$  bo'yicha hosilasining  $t = 1$  dagi qiymatini toping.

21.68.  $w = f(z, \sigma)$ ,  $r = \sqrt{x^2 + y^2}$ ,  $\sigma = \operatorname{arctg} \frac{y}{x}$  bo'lsin. U holda,  $\frac{\partial w}{\partial x}$  va  $\frac{\partial w}{\partial y}$  larni toping va javobingizni  $r$  va  $\sigma$  orqali ifodalang.

Quyidagi misollarda: a) zanjir qoidasidan foydalanim; b) bevosita  $t$  bo'yicha differensialab,  $\frac{dW}{dt}$  ni  $t$  ning funksiyasi sifatida ifodalang, so'ngra  $\frac{dW}{dt}$  ning berilgan  $t = t_0$  nuqtadagi qiymatini toping:

$$21.69. W = x^2 + y^2, \quad x = \cos t, \quad y = \sin t; \quad t_0 = \pi.$$

$$21.70. W = \frac{x}{z} + \frac{y}{z}, \quad x = \cos^2 t, \quad y = \sin^2 t, \quad z = \frac{1}{t}; \quad t_0 = 3.$$

$$21.71. W = 2ye^x - \ln z, \quad x = \ln(t^2 + 1), \quad y = \operatorname{arctg} t, \quad z = e^t; \quad t_0 = 1.$$

**21.72.** Agar  $W = (x+y+z)^2$ ,  $x = r-s$ ,  $y = \cos(r+s)$ ,  $z = \sin(r+s)$  bo'lsa,

$$\frac{\partial W}{\partial r} \Big|_{(r,s)=(1,-1)} \text{ toping.}$$

**21.73.** Agar  $W = x^2 + \frac{y}{x}$ ,  $x = u - 2v + 1$ ,  $y = 2u + v - 2$  bo'lsa,  $\frac{\partial W}{\partial u} \Big|_{(u,v)=(0,0)}$  ni

toping.

**21.74.** Agar  $W = \operatorname{arctg} x$  va  $x = e^u + \ln v$  bo'lsa,  $\frac{\partial W}{\partial u} \Big|_{(u,v)=(\ln 2,1)}$ ,  $\frac{\partial W}{\partial v} \Big|_{(u,v)=(\ln 2,1)}$

larni toping.

**21.75.** Agar  $a$  va  $b$  - o'zgarmas sonlar,  $w = u^3 + thu + \cos u$  va  $u = ax + by$  bo'lsa,  $a \frac{\partial w}{\partial y} = b \frac{\partial w}{\partial x}$  munosabat o'rinali ekanligini ko'sating.

**21.76.** Agar  $f(u)$  ixtiyoriy differensiallanuvchi funksiya bo'lsa, u holda,  $\varphi(x,y) = yf(x^2 - y^2)$  funksiya,  $y^2 \frac{\partial \varphi}{\partial x} + xy \frac{\partial \varphi}{\partial y} = x\varphi$  tenglamani qanoatlantirishini isbotlang.

**21.77.** Agar  $f(u)$  ixtiyoriy differensiallanuvchi funksiya bo'lsa, u holda,  $\varphi(x,y) = xy + xf\left(\frac{y}{x}\right)$  funksiya,  $x \frac{\partial \varphi}{\partial x} + y \frac{\partial \varphi}{\partial y} = xy + \varphi$  tenglamani qanoatlantirishini isbotlang.

**21.78.** Agar  $f(u)$  ixtiyoriy differensiallanuvchi funksiya bo'lsa, u holda,  $\varphi(x,y) = \sin x + f(\sin y - \sin x)$  funksiya,  $\cos y \frac{\partial \varphi}{\partial x} + \cos x \frac{\partial \varphi}{\partial y} = xy + \varphi$  tenglamani qanoatlantirishini isbotlang.

**21.79.** Agar  $f(u,v)$  ixtiyoriy differensiallanuvchi funksiya bo'lsa, u holda,  $\varphi(x,y,z) = f\left(\frac{x}{y}, x^2 + y - z^2\right)$  funksiya,  $2xz \frac{\partial \varphi}{\partial x} + 2yz \frac{\partial \varphi}{\partial y} + (2x^2 + y) \frac{\partial \varphi}{\partial z} = 0$  tenglamani qanoatlantirishini isbotlang.

**21.80.** Agar  $w = f(s) - s$  ning differensiallanuvchi funksiyasi,  $s = y + 5x$  bo'lsa, u holda  $\frac{\partial w}{\partial x} - 5 \frac{\partial w}{\partial y} = 0$  musbat bajarilishini ko'rsating.

**21.81.** Agar  $a$  va  $b$  - o'zgarmas sonlar,  $w = u^3 + thu + \cos u$  va  $u = ax + by$  bo'lsa,  $a \frac{\partial w}{\partial y} = b \frac{\partial w}{\partial x}$  musbat o'rinali ekanligini ko'sating.

**21.82.** Agar  $f(u, v, w)$  differensiallanuvchi funksiya va  $u = x - y$ ,  $v = y - z$  hamda  $w = z - x$  bo'lsa,  $\frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} + \frac{\partial f}{\partial z} = 0$  ekanligini ko'rsating.

**21.83.** Faraz qilaylik,  $W = f(x, y)$  differensiallanuvchi funksiyada  $x = r \cos \theta$  va  $y = r \sin \theta$  qutb koordinatalariga o'tish amalga oshirilgan (qutb almashtirishlari bajarilgan) bo'lsin. U holda

$$a) \frac{\partial W}{\partial r} = f_x \cos \theta + f_y \sin \theta, \quad \frac{1}{r} \frac{\partial W}{\partial \theta} = -f_x \sin \theta + f_y \cos \theta,$$

ekanligini ko'rsating;

b) a) banddag'i tenglamalarni  $f_x$  va  $f_y$  larga nisbatan Yechib, ularni  $\frac{\partial W}{\partial r}$  va  $\frac{\partial W}{\partial \theta}$  lar orqali ifodalang;

$$c) (f_x)^2 + (f_y)^2 = \left( \frac{\partial W}{\partial r} \right)^2 + \frac{1}{r^2} \left( \frac{\partial W}{\partial \theta} \right)^2$$

ekanligini ko'rsating.

**21.84.**  $f$  va  $g = x$  va  $y$  ning shunday funksiyalardan iboratki,  $\frac{\partial f}{\partial y} = \frac{\partial g}{\partial x}$  va  $\frac{\partial f}{\partial x} = \frac{\partial g}{\partial y}$  munosabat o'rinni bo'lsin. Faraz qilaylik,  $\frac{\partial f}{\partial x} = 0$ ,  $f(1, 2) = g(1, 2) = 5$  va  $f(0, 0) = 4$  bo'lsin. U holda,  $f(x, y)$  va  $g(x, y)$  larni toping.

**21.85.** Birinchi tartibli xususiy hosilalardan  $\frac{\partial w}{\partial x} = 1 + e^x \cos y$  va  $\frac{\partial w}{\partial y} = 2y - e^x \sin y$  hamda  $(\ln 2, 0)$  nuqtadagi qiymatini  $2 + \ln 2$  ga teng bo'lgan ( $f(\ln 2, 0) = 2 + \ln 2$ ),  $w = f(x, y)$  funksiyani toping.

**21.86.** Agar  $u = f(x, y, z)$  funksiya biror  $E$  sohada differensiallanuvchi bo'lib,  $x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} + z \frac{\partial u}{\partial z} = pu$  tenglamani qanoatlantirsa, u holda, uning  $p$ -darajali birjinsli funksiya bo'lishini isbotlang.

**21.87.** Agar  $u = f(x, y, z)$  funksiya biror  $E$  sohada ikki marta differensiallanuvchi bo'lsa, u holda,

$$\left( x \frac{\partial}{\partial x} + y \frac{\partial}{\partial y} + z \frac{\partial}{\partial z} \right)^2 u = p(p-1)u$$

tenglikning o'rinni ekanligini isbotlang.

**21.88.** Ushbu  $u = x^y y^x$  funksiya  $x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = (x+y+\ln u)u$  tenglamani qanoatlantirishini isbotlang.

**21.89.** Ushbu  $u = \frac{x-y}{z-t} + \frac{t-x}{y-z}$  funksiya  $\frac{\partial u}{\partial x} + \frac{\partial u}{\partial y} + \frac{\partial u}{\partial z} + \frac{\partial u}{\partial t} = 0$  tenglamani qanoatlantirishni isbotlang.

Quyidagi funksiyaning  $M_0$  nuqtada  $\vec{M_0 M}$  yo‘nalish bo‘yicha hosilasini toping:

$$21.90. f(x, y) = 5x + 10x^2y + y^5, \quad M_0(1, 2), \quad M(5, -1)$$

$$21.91. f(x, y) = xy^2z^3, \quad M_0(3, 2, 1), \quad M(7, 5, 1)$$

$$21.92. f(x, y, z) = \arcsin \frac{z}{\sqrt{x^2 + y^2}}, \quad M_0(1, 1, 1), \quad M(1, 5, 4)$$

21.93. Ushbu  $f(x, y) = 3x^4 + y^3 + xy$  funksiyaning  $M_0(1, 2)$  nuqtada,  $Ox$  o‘q bilan  $135^\circ$  burchak tashkil qilgan nurning yo‘nalishi bo‘yicha hosilasini toping.

21.94. Ushbu  $f(x, y) = \operatorname{arctg} \frac{y}{x}$  funksiyaning  $x^2 + y^2 = 2x$  aylanining  $M_0\left(\frac{1}{2}, \frac{\sqrt{3}}{2}\right)$  nuqtasiga o‘tkazilgan tashqi normalning yo‘nalishi bo‘yicha hosilasini toping.

21.95. Quyidagi  $f(x, y, z) = \ln(e^x + e^y + e^z)$  funksiyaning  $M_0(0, 0, 0)$  nuqtada,  $Ox, Oy, Oz$  koordinatalar o‘qlari bilan, mos ravishda,  $\frac{\pi}{3}, \frac{\pi}{4}$  va  $\frac{\pi}{3}$  burchaklarni tashkil qilgan nuring yo‘nalishi bo‘yicha hosilasini toping.

21.96-21.97- misollarda berilgan  $f(x, y)$  funksiyaning  $P_0$  nuqtada kamayish va o‘sish yo‘nalishlarini toping va har bir yo‘nalish bo‘yicha hosilasini toping. Shuningdek,  $f(x, y)$  funksiyaning  $P_0$  nuqtada  $\vec{v}$  vektor yo‘nalishidagi hosilasini toping.

$$21.96. f(x, y) = \cos x \cos y, \quad P_0\left(\frac{\pi}{4}, \frac{\pi}{4}\right), \quad \vec{v} = 3\vec{i} + 4\vec{j}.$$

$$21.97. f(x, y, z) = \ln(2x + 3y + 6z), \quad P_0(-1, -1, 1), \quad \vec{v} = 2\vec{i} + 3\vec{j} + 6\vec{k}.$$

Quyidagi skalar maydonning berilgan nuqtadagi gradientini toping:

$$21.98. u(x, y) = x^2 - 2xy + 3y - 1, \quad \operatorname{grad} u|_{M(x,y)} = ?$$

$$21.99. u(x, y) = 5x^2y - 3xy^3 + y^4, \quad \operatorname{grad} u|_{M(x,y)} = ?$$

$$21.100. u = x^2 + y^2, \quad \operatorname{grad} u|_{(3,2)} = ?$$

$$21.101. u = \sqrt{4 + x^2 + y^2}, \quad \operatorname{grad} u|_{(2,1)} = ?$$

$$21.102. u = \operatorname{arctg} \frac{y}{x}, \quad \operatorname{grad} u|_{(0,1)} = ?$$

21.103.  $u = \operatorname{arctg} \frac{x}{y}$  skalyar maydonning  $(1; 1)$  va  $(-1; -1)$  nuqtalardagi gradientlari orasidagi burchakni toping.

21.104.  $z_1 = \sqrt{x^2 + y^2}, \quad z_2 = x - 3y + \sqrt{3xy}$  funksiyalarning  $(3, 4)$  nuqtadagi gradientlari orasidagi burchakni toping.

**21.105.**  $\operatorname{grad}(\varphi\psi) = \varphi \operatorname{grad}\psi + \psi \operatorname{grad}\varphi$  tenglikni isbotlang.

**21.106.**  $z = \varphi(u, v)$ ,  $u = \psi(x, y)$ ,  $v = \zeta(x, y)$  funksiyalar berilganda,

$\operatorname{grad} z = \frac{\partial \varphi}{\partial u} \operatorname{grad} u + \frac{\partial \varphi}{\partial v} \operatorname{grad} v$  tenglikning to‘g‘riligini ko‘rsating.

**21.107-21.111** misollarda funksiyaning orttirmasini uning differensialiga almashtirib, quyida berilgan ifodalarni taqrifiy hisoblang:

$$\mathbf{21.107.} (1,02)^{4,05}. \quad \mathbf{21.108.} \sqrt{8,04^2 + 6,03^2}. \quad \mathbf{21.109.} (1,02)^3 \cdot (0,97)^2.$$

$$\mathbf{21.110.} \sin 32^\circ \cos 59^\circ. \quad \mathbf{21.111.} \ln(0,9^3 + 0,99^3). \quad \mathbf{21.112.} \sqrt{2,03^2 + 5e^{0,02}}.$$

## 22 -§. Ko‘p o‘zgaruvchili funksiyaning yuqori tartibli xususiy hosilalari va differensiallari

**22.1. Yuqori tartibli xususiy hosilalar.**  $u = f(x_1, x_2, \dots, x_m) = f(M)$  funksiya  $\{M\} \subset R^m$  ochiq to‘plamda berilgan bo‘lib, uning har bir  $M(x_1, x_2, \dots, x_m)$  nuqtasida  $f'_{x_1}, f'_{x_2}, \dots, f'_{x_m}$  xususiy hosilalarga ega bo‘lsin. Bu xususiy hosilalar, o‘z navbatida,  $x_1, x_2, \dots, x_m$  o‘zgaruvchilarining funksiysi sifatida,  $\{M\}$  to‘plamda aniqlangan bo‘lsin.

$\frac{\partial u}{\partial x_i}$  ( $i = 1, 2, \dots, m$ ) funksiya ham, biror  $M \in \{M\}$  nuqtada  $x_k$  argument bo‘yicha xususiy hosilaga ega bo‘lishi mumkin. Bu  $x_k$  argument bo‘yicha xususiy hosila- berilgan  $u = f(x_1, x_2, \dots, x_m)$  funksiyaning ikkinchi tartibli xususiy hosilasi deyiladi va u  $\frac{\partial^2 u}{\partial x_k \partial x_i}$ ,  $f^{(2)}_{x_k x_i}$ ,  $u^{(2)}_{x_k x_i}$  ( $i = 1, 2, \dots, m$ ;  $k = 1, 2, \dots, m$ ) kabi belgilanadi, bunda,  $i \neq k$  bo‘lsa, u holda,  $\frac{\partial^2 u}{\partial x_k \partial x_i}$  xususiy hosilaga, aralash xususiy hosila deyiladi,  $k = i$  bo‘lganda  $\frac{\partial^2 u}{\partial x_k \partial x_k} = f''$  deb yozish o‘rniga,  $\frac{\partial^2 u}{\partial x_k^2} = f''_{x_k}$  kabi yoziladi. Xuddi shunday,  $f(x_1, x_2, \dots, x_m)$  funksiyaning uchinchi, to‘rtinchchi, va xokazo, tartibli xususiy hosilalarining ta’rifi beriladi.  $f(x_1, x_2, \dots, x_m)$  funksiya  $x_{i_1}, x_{i_2}, \dots, x_{i_n}$  argumentlari bo‘yicha ( $n-1$ )-tartibli xususiy hosilalarga ega bo‘lsin. Bu ( $n-1$ ) tartibli xususiy hosilalar ham,  $M(x_1, x_2, \dots, x_m) \in \{M\}$  nuqtada  $x_{i_n}$  argumenti bo‘yicha xususiy hosilaga ega bo‘lsin. Bu hosila,  $u = f(x_1, x_2, \dots, x_m)$  funksiyaning  $x_{i_1}, x_{i_2}, \dots, x_{i_n}$  argumentlar bo‘yicha  $M$  nuqtadagi  $n$ -tartibli xususiy hosilasi deyiladi. Shunday qilib,  $x_{i_1}, x_{i_2}, \dots, x_{m-1}, x_m$  argumentlar bo‘yicha  $n$ -tartibli xususiy hosilani,

$$\frac{\partial^n u}{\partial x_m \partial x_{m-1} \dots \partial x_{i_2} \partial x_{i_1}} = \frac{\partial}{\partial x_m} \left( \frac{\partial^{n-1} u}{\partial x_{m-1} \dots \partial x_{i_2} \partial x_{i_1}} \right)$$

kabi yozish mumkin. Agar  $i_1, i_2, \dots, i_n$  indekslarning hammasi bordaniga bir-biriga teng bo‘lmasa, u holda  $\frac{\partial^n u}{\partial x_m \dots \partial x_{i_2} \partial x_{i_1}}$  xususiy hosila  $n$ -tartibli aralash xususiy hosila deyiladi.

**22.1-misol.** Ushbu  $f(x, y) = \ln(x^2 + y^2)$  funksiya  $\frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2} = 0$  tenglamani qanoatlantirishini ko'rsating.

**Yechilishi.** Berilgan funksiyaning  $x$  va  $y$  bo'yicha ikkinchi tartibli xususiy hosilalarini topamiz:

$$\begin{aligned}\frac{\partial f(x, y)}{\partial x} &= \frac{2x}{x^2 + y^2}, \quad \frac{\partial f(x, y)}{\partial y} = \frac{2y}{x^2 + y^2}, \\ \frac{\partial^2 f(x, y)}{\partial x^2} &= \frac{2(y^2 - x^2)}{(x^2 + y^2)^2}, \quad \frac{\partial^2 f(x, y)}{\partial y^2} = \frac{2(x^2 - y^2)}{(x^2 + y^2)^2}.\end{aligned}$$

$\frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2} = 0$  tenglamaga ikkinchi tartibli xususiy hosilalarni keltirib qo'yamiz:

$$\frac{\partial^2 f(x, y)}{\partial x^2} + \frac{\partial^2 f(x, y)}{\partial y^2} = 0 \Rightarrow \frac{2(y^2 - x^2)}{(x^2 + y^2)^2} + \frac{2(x^2 - y^2)}{(x^2 + y^2)^2} = 0$$

Demak, berilgan funksiya tenglamani qanoatlantirir ekan.

**22.1-teorema.**  $u = f(x, y)$  funksiya  $\{M\} \subset R^2$  ochiq to'plamda aniqlangan bo'lib, shu to'plamda  $f'_x, f'_y, f''_{xy}, f''_{yx}$  xususiy hosilalarga ega bo'lsin. Agar aralash hosilalar  $M_0(x_0, y_0) \in \{M\}$  nuqtada uzlusiz bo'lsa, u holda, shu nuqtada,

$$f''_{xy}(x_0, y_0) = f''_{yx}(x_0, y_0)$$

bo'ladi.

**22.2-misol.** Ushbu  $f(x, y) = x^2 - 2xy^2$  funksiyaning ikkinchi tartibli xususiy hosilalarini toping hamda  $\frac{\partial^2 f}{\partial x \partial y}$  va  $\frac{\partial^2 f}{\partial y \partial x}$  aralash xususiy hosilalarning o'zaro tengligini ko'rsating.

**Yechilishi.** Berilgan funksiyaning birinchi va ikkinchi tartibli xususiy hosilalarini topamiz:

$$\begin{aligned}f'_x(x, y) &= 2x - 2y^2, \quad f'_y = -4xy, \\ f''_{xz}(x, y) &= 2, \quad f''_{yz} = -4x, \quad f''_{xy}(x, y) = -4y, \quad f''_{yx} = -4y.\end{aligned}$$

Endi, aralash xususiy hosilalarni  $\frac{\partial^2 f}{\partial x \partial y} = \frac{\partial^2 f}{\partial y \partial x}$  tenglikka keltirib qo'yamiz:

$$\frac{\partial^2 f}{\partial x \partial y} = \frac{\partial^2 f}{\partial y \partial x} = -4y.$$

**22.3-misol.** Ushbu  $u = \operatorname{arctg} \frac{x}{y}$  funksiyaning ikkinchi tartibli xususiy hosilalarini toping.

**Yechilishi.** Birinchi va ikkinchi tartibli xususiy hosilalarni topamiz:

$$\begin{aligned}\frac{\partial u}{\partial x} &= \frac{y}{x^2 + y^2}, & \frac{\partial u}{\partial y} &= -\frac{x}{x^2 + y^2}, \\ \frac{\partial^2 u}{\partial x \partial y} &= \frac{x^2 + y^2}{(x^2 + y^2)^2}, & \frac{\partial^2 u}{\partial x^2} &= -\frac{2xy}{(x^2 + y^2)^2}, \\ \frac{\partial^2 u}{\partial y \partial x} &= \frac{x^2 - y^2}{(x^2 + y^2)^2}, & \frac{\partial^2 u}{\partial y^2} &= -\frac{2x}{(x^2 + y^2)^2}.\end{aligned}$$

Bu misolda  $\frac{\partial^2 u}{\partial y \partial x}$  va  $\frac{\partial^2 u}{\partial x \partial y}$  aralash xususiy hosilalar bir-biriga teng.

Umumiy holda, bu aralash xususiy hosilalar bir-biriga teng bo'lmassligi ham mumkin.

*Misolni Maple tizimidan foydalanib yechish:*

```
> z:=arctan(x/y):diff(z,x,y);diff(z,y,x);
```

$$\begin{aligned}&-\frac{1}{y^2 \left(1 + \frac{x^2}{y^2}\right)} + \frac{2x^2}{y^4 \left(1 + \frac{x^2}{y^2}\right)^2} \\&-\frac{1}{y^2 \left(1 + \frac{x^2}{y^2}\right)} + \frac{2x^2}{y^4 \left(1 + \frac{x^2}{y^2}\right)^2}\end{aligned}$$

#### 22.4-misol. Ushbu

$$u = \begin{cases} xy \frac{x^2 - y^2}{x^2 + y^2}, & x^2 + y^2 \neq 0, \\ 0, & x^2 + y^2 = 0 \end{cases}$$

funksiyaning  $\frac{\partial^2 u}{\partial y \partial x}$  va  $\frac{\partial^2 u}{\partial x \partial y}$  aralash xususiy hosilalarining  $M_0(0,0)$  nuqtada mavjudligi va ularning bir-biriga teng emasligini ko'rsating.

**Yechilishi.** Birinchi tartibli xususiy hosilalarni topamiz:

$$\frac{\partial u}{\partial x} = \begin{cases} \frac{y(x^4 - y^4 + 4x^2y^2)}{(x^2 + y^2)^2}, & x^2 + y^2 \neq 0, \\ 0, & x^2 + y^2 = 0 \end{cases}$$

bo'lgani uchun,

$$\frac{\partial^2 u}{\partial y \partial x} \Big|_{\substack{x=0 \\ y=0}} = \lim_{y \rightarrow 0} \frac{\frac{\partial u}{\partial x} \Big|_{\substack{x=0, \\ y \neq 0}} - \frac{\partial u}{\partial x} \Big|_{\substack{x=0, \\ y=0}}}{y} = -1.$$

Xuddi shunday,  $\frac{\partial^2 u}{\partial x \partial y} \Big|_{\substack{x=0, \\ y=0}} = 1$  ekanligini topamiz. Shunday qilib,

$M_0(0,0)$  nuqtada  $\frac{\partial^2 u}{\partial x \partial y} \neq \frac{\partial^2 u}{\partial y \partial x}$  ekan.

**22.2-teorema.**  $u = f(x_1, x_2, \dots, x_m)$  funksiya  $\{M\} \subset R^m$  ochiq to'plamda aniqlangan, bu to'plamda mumkin bo'lgan hamma  $(n-1)$ -tartibgacha xususiy hosilalarga va  $n$ -tartibli aralash hosilalarga ega bo'lib, bu hosilalar  $\{M\}$  to'plamda uzuksiz bo'lsa, u holda ixtiyoriy  $n$ -tartibli aralash hosilaning ifodasi, hosilani topish tartibiga bog'liq bo'lmaydi.

**22.2. Yuqori tartibli differensiallar.** Ko'p o'zgaruvchili funksianing yuqori tartibli differensiali tushunchasini kiritishdan avval, funksianing  $n$  marta differensiallanuvchanligi tushunchasini kiritamiz.

$u = f(x_1, x_2, \dots, x_m) = f(M)$  funksiya  $\{M\} \subset R^m$  ochiq to'plamda berilgan bo'lib,  $M_0(x_1^0, x_2^0, \dots, x_m^0) \in \{M\}$  bo'lsin.  $u = f(x_1, x_2, \dots, x_m)$  funksiya  $\{M\}$  to'plamda  $f'_{x_1}, f'_{x_2}, \dots, f'_{x_m}$  xususiy hosilalarga ega bo'lsin. Agar  $f'_{x_1}, f'_{x_2}, \dots, f'_{x_m}$  funksiyalar  $M_0$  nuqtada differensiallanuvchi bo'lsa,  $f(M)$  funksiya  $M_0$  nuqtada ikki marta differensiallanuvchi deyiladi.

Agar  $f(M)$  funksiya  $\{M\}$  to'plamda  $(n-1)$ -tartibli xususiy hosilalarga ega bo'lib, bu xususiy hosilalar  $M_0$  nuqtada differensiallanuvchi bo'lsa,  $f(M)$  funksiya  $n$  marta differensiallanuvchi deb ataladi.

**22.3-teorema.** Agar  $\{M\} \subset R^m$  ochiq to'plamda  $f(M)$  funksianing  $n$ -tartibligacha barcha xususiy hosilalari mavjud va  $M_0 \in \{M\}$  nuqtada uzuksiz bo'lsa,  $f(M)$  funksiya  $M_0$  nuqtada  $n$ -marta differensiallanuvchi bo'ladi.  $u = f(x_1, x_2, \dots, x_m) = f(M)$  funksiya  $\{M\} \subset R^m$  ochiq to'plamda berilgan bo'lib,  $M \in \{M\}$  nuqtada differensiallanuvchi bo'lsa, u holda, uning  $M$  nuqtadagi differensiali

$$du = \frac{\partial u}{\partial x_1} dx_1 + \frac{\partial u}{\partial x_2} dx_2 + \dots + \frac{\partial u}{\partial x_m} dx_m \quad (22.1)$$

ko'rinishda bo'ladi, bunda  $dx_1, dx_2, \dots, dx_m$  lar  $x_1, x_2, \dots, x_m$  o'zgaruvchilarning ixtiyoriy ortirmalaridir.

Faraz qilaylik,  $f(M)$  funksiya  $M \in \{M\}$  nuqtada ikki marta differensiallanuvchi bo'lsin.  $f(M)$  funksianing  $M$  nuqtadagi differensiali  $df(M)$  ning differensiali, berilgan  $f(M)$  funksianing ikkinchi tartibili differensiali deb ataladi va u  $d^2f = d(df)$  kabi belgilanadi. (22.1) formulani e'tiborga olib, differensiallash formulalaridan foydalansak, quyidagini topamiz:

$$\begin{aligned} d^2u &= d(du) = d\left(\frac{\partial u}{\partial x_1} dx_1 + \frac{\partial u}{\partial x_2} dx_2 + \dots + \frac{\partial u}{\partial x_m} dx_m\right) = d\left(\frac{\partial u}{\partial x_1}\right) dx_1 + d\left(\frac{\partial u}{\partial x_2}\right) dx_2 + \dots + d\left(\frac{\partial u}{\partial x_m}\right) dx_m = \\ &= \left(\frac{\partial^2 u}{\partial x_1^2} dx_1 + \frac{\partial^2 u}{\partial x_1 \partial x_2} dx_2 + \dots + \frac{\partial^2 u}{\partial x_1 \partial x_m} dx_m\right) dx_1 + \dots + \left(\frac{\partial^2 u}{\partial x_m \partial x_1} dx_1 + \dots + \frac{\partial^2 u}{\partial x_m^2} dx_m\right) dx_m = \\ &= \frac{\partial^2 u}{\partial x_1^2} dx_1^2 + \frac{\partial^2 u}{\partial x_2^2} dx_2^2 + \dots + 2 \frac{\partial^2 u}{\partial x_{m-1} \partial x_m} dx_{m-1} dx_m \end{aligned} \quad (22.2)$$

$u = f(x_1, x_2, \dots, x_n) = f(M)$  funksiyaning uchinchi, to‘rtinchi va hokazo tartibli differensiallari ham xuddi yuqoridagidek ta‘riflanadi. Shunday qilib,  $f(M)$  funksiyaning  $M$  nuqtadagi  $(n-1)$ - tartibli differensial  $d^{n-1}u$  ning differensialiga berilgan  $f(M)$  funksiyaning  $n$ -tartibli differensiali deyiladi va  $d^n u = d(d^{n-1}u)$  kabi belgilanadi. (22.2) formuladan ko‘rinadiki, yuqori tartibli differensialning tartibi oshgan sari uning xususiy hosilalar orqali ifodasi murakkablashib boradi. Shu sababli, yuqori tartibli differensiallarni soddaroq shaklda ifodalash uchun,  $f(M)$  funksiyaning

$$du = \frac{\partial u}{\partial x_1} dx_1 + \frac{\partial u}{\partial x_2} dx_2 + \dots + \frac{\partial u}{\partial x_n} dx_n$$

differensialini, simvolik ravishda ( $u$  ni formal ravishda qavsdan tashkariga chiqarib), quyidagicha

$$du = \left( \frac{\partial}{\partial x_1} dx_1 + \frac{\partial}{\partial x_2} dx_2 + \dots + \frac{\partial}{\partial x_n} dx_n \right) u$$

yozamiz. Unda funksiyaning ikkinchi tartibli differensial,

$$d^2 u = \left( \frac{\partial}{\partial x_1} dx_1 + \frac{\partial}{\partial x_2} dx_2 + \dots + \frac{\partial}{\partial x_n} dx_n \right)^2 u$$

kabi yozilishi mumkin. Bunda, simvolik ravishda, qavs ichidagi yig‘indi kvadratga ko‘tarilib, so‘ngra  $u$  ga «*ko‘paytiriladi*», bunda daraja ko‘rsatkichlari xususiy hosilalarning tartibi, deb qaraladi. Xuddi shunday, simvolik ravishda, funksiyaning  $n$ -tartibli differensiali

$$d^n u = \left( \frac{\partial}{\partial x_1} dx_1 + \frac{\partial}{\partial x_2} dx_2 + \dots + \frac{\partial}{\partial x_n} dx_n \right)^n u$$

kabi yoziladi.

Xususiy holda,  $x$  va  $y$  erkli o‘zgaruvchilarga bog‘liq bo‘lgan  $u = f(x, y)$  funksiyaning ikkinchi va uchinchi tartibli to‘liq differensiallarini, quyidagi

$$\begin{aligned} d^2 u &= \left( \frac{\partial}{\partial x} dx + \frac{\partial}{\partial y} dy \right)^2 u = \frac{\partial^2 u}{\partial x^2} dx^2 + 2 \frac{\partial^2 u}{\partial x \partial y} dxdy + \frac{\partial^2 u}{\partial y^2} dy^2 = \\ &= u_{xx} dx^2 + 2u_{xy} dxdy + u_{yy} dy^2, \end{aligned} \quad (22.3)$$

$$\begin{aligned} d^3 u &= \left( \frac{\partial}{\partial x} dx + \frac{\partial}{\partial y} dy \right)^3 u = \frac{\partial^3 u}{\partial x^3} dx^3 + 3 \frac{\partial^3 u}{\partial x^2 \partial y} dx^2 dy + 3 \frac{\partial^3 u}{\partial x \partial y^2} dxdy^2 + \frac{\partial^3 u}{\partial y^3} dy^3 = \\ &= u_{xxx} dx^3 + 3u_{xxy} dx^2 dy + 3u_{xyy} dxdy^2 + u_{yyy} dy^3. \end{aligned}$$

ko‘rinishlarda yozish mumkin.

**22.9-misol.** Ushbu  $u = x^2 - y^2 - \ln \frac{x}{y}$  funksiyaning ikkinchi tartibli to‘liq differensialini toping.

**Yechilishi.** Dastlab berilgan funksiyaning birinchi tartibli xususiy hosilalarini topamiz:  $\frac{\partial u}{\partial x} = 2x - \frac{1}{x}$ ,  $\frac{\partial u}{\partial y} = -2y - \frac{1}{y}$ . Ikkinchchi tartibli xususiy hosilalarini topib, (22.3) formulaga keltirib qo'yamiz:

$$\begin{aligned}\frac{\partial^2 u}{\partial x^2} &= 2 + \frac{1}{x^2}, & \frac{\partial^2 u}{\partial y^2} &= -2 + \frac{1}{y^2}, & \frac{\partial^2 u}{\partial x^2} &= 2 + \frac{1}{x^2}, & \frac{\partial^2 u}{\partial x \partial y} &= 0 \\ d^2 u &= u_{x^2} dx^2 + 2u_{xy} dx dy + u_{y^2} dy^2 = (2 + \frac{1}{x^2}) \cdot dx^2 + (\frac{1}{y^2} - 2) \cdot dy^2.\end{aligned}$$

**22.3. Murakkab funksiyaning yuqori tartibli differensiallari.** Biz yuqorida qaragan,  $u = f(x_1, x_2, \dots, x_m)$  ( $x_i = \varphi_i(t_1, t_2, \dots, t_k), i = 1, 2, \dots, m$ ) murakkab funksiyaning yuqori tartibli differensialini topamiz.

Ma'lumki,  $x_i = \varphi_i(t_1, t_2, \dots, t_k), (i = 1, 2, \dots, m)$  funksiyalarning har biri  $N_0(t_1^0, t_2^0, \dots, t_k^0) \in \{N\} \subset R^k$  nuqtada differensiallanuvchi bo'lib,  $u = f(x_1, x_2, \dots, x_m)$  funksiya esa, mos ravishda,  $M_0(x_1^0, x_2^0, \dots, x_m^0) \in \{N\} \subset R^m$  nuqtada differensiallanuvchi bo'lsa, u holda, 21.3-teoremaga asosan, murakkab funksiya  $N_0 \in \{N\} \subset R^k$  nuqtada differensiallanuvchi bo'ladi va differensial shaklining invariantlik xossasiga asosan, murakkab funksiyaning differensiali,

$$du = \frac{\partial u}{\partial x_1} dx_1 + \frac{\partial u}{\partial x_2} dx_2 + \dots + \frac{\partial u}{\partial x_m} dx_m$$

ko'rinishda bo'ladi. Faraz qilaylik,  $x_i = \varphi_i(t_1, t_2, \dots, t_k), (i = 1, 2, \dots, m)$  funksiyalarning har biri  $N_0(t_1^0, t_2^0, \dots, t_k^0) \in \{N\} \subset R^k$  nuqtada ikki marta differensiallanuvchi,  $f(x_1, x_2, \dots, x_m)$  funksiya esa, unga mos,  $M_0(x_1^0, x_2^0, \dots, x_m^0) \in \{N\} \subset R^m$  nuqtada, ikki marta differensiallanuvchi bo'lsin. U holda murakkab funksiya ham,  $N_0(t_1^0, t_2^0, \dots, t_k^0)$  nuqtada ikki marta differensiallanuvchi bo'ladi. Differensiallash qoidalaridan foydalanib, funksiyaning ikkinchi tartibli differensialini topamiz:

$$\begin{aligned}d^2 u &= d(du) = d\left(\frac{\partial u}{\partial x_1} dx_1 + \frac{\partial u}{\partial x_2} dx_2 + \dots + \frac{\partial u}{\partial x_m} dx_m\right) = d\left(\frac{\partial u}{\partial x_1}\right) dx_1 + \frac{\partial u}{\partial x_1} d(dx_1) + d\left(\frac{\partial u}{\partial x_2}\right) dx_2 + \\ &+ \frac{\partial u}{\partial x_2} d(dx_2) + \dots + d\left(\frac{\partial u}{\partial x_m}\right) dx_m + \frac{\partial u}{\partial x_m} d(dx_m) = \left(\frac{\partial}{\partial x_1} dx_1 + \frac{\partial}{\partial x_2} dx_2 + \dots + \frac{\partial}{\partial x_m} dx_m\right)^2 u + \\ &+ \frac{\partial u}{\partial x_1} d^2 x_1 + \frac{\partial u}{\partial x_2} d^2 x_2 + \dots + \frac{\partial u}{\partial x_m} d^2 x_m\end{aligned}\quad (22.4)$$

Xuddi shunday usulda murakkab funksiyaning, keyingi, yuqori tartibli differensiallari ham topiladi.

(22.1) va (22.4) formulalarni solishtirish natijasida, ikkinchi tartibli differensiallarda differensial shakli invariantligining saqlanmasligini ko'ramiz.

**22.5-eslatma.** Agar  $x_i = \varphi_i(t_1, t_2, \dots, t_k)$ , ( $i=1, 2, \dots, m$ ) funksiyalarning har biri,  $(t_1, t_2, \dots, t_k)$  o‘zgaruvchilarning

$$x_1 = a_{11}t_1 + a_{12}t_2 + \dots + a_{1k}t_k + \beta_1,$$

$$\dots$$

$$x_m = a_{m1}t_1 + a_{m2}t_2 + \dots + a_{mk}t_k + \beta_m$$

chiziqli funksiyalari bo‘lsa, u holda,  $f(x_1, x_2, \dots, x_m)$  murakkab funksiyaning yuqori tartibli differensialari shakli invariantligi saqlanishini ko‘rish qiyin emas.

**22.10-misol.** Ushbu  $W = f(u, v)$ ,  $u(x, y) = x \sin y$ ,  $v(x, y) = y \cos x$  murakkab funksiyaning ikkinchi tartibli differensialini toping.

**Yechilishi.** Ma’lumki,  $W = f(u, v)$  funksiyaning birinchi tartibli differensiali  $dW = f'_u du + f'_v dv$ , murakkab funksiyaning ikkinchi tartibli differensiali esa,

$$d^2W = d(dW) = d(f'_u du + f'_v dv) = (f''_{uu} du + f''_{uv} dv)du + f''_{u1} \cdot d^2u + (f''_{vu} du + f''_{vv} dv)dv + f''_{v1} \cdot d^2v,$$

ko‘rinishda bo‘ladi, bunda  $du = \sin y \, dx + x \cos y \, dy$ ,  $dv = -y \sin x \, dx + \cos x \, dy$ ,

$$d^2u = 2 \cos y \cdot dx dy - x \sin y \, d^2y, \quad d^2v = -\cos x \, d^2x - 2 \sin x \, dx dy.$$

Endi, bu ifoda-larni murakkab funksiyaning ikkinchi tartibli differensialini topish formulasiga keltirib qo‘yamiz:

$$d^2W = [f''_{uu}(\sin y \, dx + x \cos y \, dy) + f''_{uv}(-y \sin x \, dx + \cos x \, dy)](\sin y \, dx + x \cos y \, dy) + \\ + f''_{u1} \cdot (2 \cos y \cdot dx dy - x \sin y \, d^2y)^2 + [f''_{vu}(\sin y \, dx + x \cos y \, dy) + \\ + f''_{vv}(-y \sin x \, dx + \cos x \, dy)](-y \sin x \, dx + \cos x \, dy) + f''_{v1} \cdot (-\cos x \, d^2x - 2 \sin x \, dx dy)^2 = \\ = [\sin^2 y \cdot f''_{uu} - 2y \sin x \sin y \cdot f''_{uv} + y^2 \sin^2 x \cdot f''_{vv} - y \cos x \cdot f''_{v1}] \, dx^2 + \\ + [x \sin 2y \cdot f''_{uu} + 2(\sin y \cos x - xy \sin x \cos y) \cdot f''_{uv} - y \sin 2x \cdot f''_{vv} + 2(\cos y \cdot f''_{u1} - \sin x \cdot f''_{v1})] \, dx dy + \\ + [x^2 \cos^2 y \cdot f''_{uu} + 2x \cos x \cos y \cdot f''_{uv} + \cos^2 x \cdot f''_{vv} - x \sin y \cdot f''_{u1}] \, dy^2.$$

**22.4. O‘rta qiymat haqidagi teorema.**  $u = f(x_1, x_2, \dots, x_m) = f(M)$

funksiya  $\{M\}$  ( $\{M\} \subset R^m$ ) to‘plamda berilgan bo‘lsin. Bu to‘plamda shunday  $A(a_1, a_2, \dots, a_m)$  va  $B(b_1, b_2, \dots, b_m)$  nuqtalarini olaylikki, bu nuqtalarni birlashtiruvchi,

$E = \{(x_1, x_2, \dots, x_m) \in R^m : a_1 + t(b_1 - a_1), x_2 = a_2 + t(b_2 - a_2), \dots, x_m = a_m + t(b_m - a_m); 0 \leq t \leq 1\}$   
to‘g‘ri chiziq kesmasi, shu  $\{M\}$  to‘plamga qarashli, ya’ni  $E \subset M$  bo‘lsin.

**22.4-teorema.** Agar  $f(M)$  funksiya  $E$  kesmaning  $A$  va  $B$  nuqtalarida uzluksiz bo‘lib, kesmaning qolgan nuqtalarida differensialuvchi bo‘lsa, u holda,  $E$  kesmada shunday  $C$  nuqta topiladiki ( $C = c(c_1, c_2, \dots, c_m)$ ),  $f(B) - f(A) = f'_{x_1}(C)(b_1 - a_1) + f'_{x_2}(C)(b_2 - a_2) + \dots + f'_{x_m}(C)(b_m - a_m)$  bo‘ladi.

**22.5. Ko‘p o‘zgaruvchili funksiyaning Teylor formulasi.**  $u = f(M)$  funksiya  $\{M\} \subset R^n$  to‘plamda berilgan bo‘lsin.  $f(M)$  funksiyaning  $M \in \{M\}$  nuqtadagi  $k$ -tartibli differensialini  $d^k u|_{M_0}$  deb belgilaymiz.

**22.5-teorema.**  $u = f(x_1, x_2, \dots, x_m) = f(M)$  funksiya  $M_0(x_1^0, x_2^0, \dots, x_m^0)$  nuqtaning  $(M_0 \in \{M\})$  biror  $U_\delta(M_0)$  atrofida  $n+1$  marta differensialanuvchi bo‘lsin. U holda, berilgan funksiyaning  $M_0(x_1^0, x_2^0, \dots, x_m^0)$  nuqtadagi  $\Delta u = f(M) - f(M_0)$  to‘liq ortirmasi quyidagi

$$\Delta u = du|_{M_0} + \frac{1}{2!} d^2 u|_{M_0} + \dots + \frac{1}{n!} d^n u|_{M_0} + \frac{1}{(n+1)!} d^{n+1} u|_N \quad (22.5)$$

ko‘rinishda tasvirlanadi, bunda  $N - U_\delta(M_0)$  atrofdagi  $M(x_1, x_2, \dots, x_m)$  nuqtaga bog‘liq bo‘lgan biror nuqta,  $d^k u|_{M_0}$  va  $d^{n+1} u|_N$  ifodalarda qatnashuvchi  $dx_i$  lar  $\Delta x_i = x_i - x_i^0$  ga teng. (22.5) formulaga  $u = f(x_1, x_2, \dots, x_m)$  funksiyaning *Teylor formulasi* deb ataladi.

Agar  $\Delta x_i = x_i - x_i^0$  ( $i = 1, 2, \dots, m$ ) deb belgilab,  $d^k u|_{M_0}$  ( $k = 1, 2, \dots, n+1$ ) to‘liq differensial ifodani ochib yozsak, u holda, (22.5) formulani quyidagicha yozish mumkin:

$$f(x_1, x_2, \dots, x_m) = f(M_0) + \frac{\partial f(M_0)}{\partial x_1}(x_1 - x_1^0) + \dots + \frac{\partial f(M_0)}{\partial x_m}(x_m - x_m^0) + \frac{1}{2!} \frac{\partial^2 f(M_0)}{\partial x_1^2}(x_1 - x_1^0)^2 + \dots + \frac{1}{n!} \frac{\partial^n f(M_0)}{\partial x_m^n}(x_m - x_m^0)^n + R_{n+1} = P_n(x_1, x_2, \dots, x_m) + R_{n+1}, \quad (22.6)$$

bunda  $P_n(x_1, x_2, \dots, x_m) = x_1, x_2, \dots, x_m$  o‘zgaruvchilarga bog‘liq bo‘lgan  $n$  darajali ko‘phad,  $R_{n+1} = \frac{1}{(n+1)!} d^{n+1} u|_N$  qoldiq ko‘phad.  $P_n(x_1, x_2, \dots, x_m)$  - ko‘phadga *Teylor ko‘phadi* deyiladi.

$n=0$  bo‘lganda, (22.6) formula, ko‘p o‘zgaruvchili funksiya uchun chekli ortirmalar haqidagi *Lagranj formulasi* deyiladi, u quyidagi

$$f(x_1^0 + \Delta x_1, x_2^0 + \Delta x_2, \dots, x_m^0 + \Delta x_m) - f(M_0) = \frac{\partial f(N)}{\partial x_1} \Delta x_1 + \dots + \frac{\partial f(N)}{\partial x_m} \Delta x_m$$

ko‘rinishga ega.

Ushbu  $\rho = \rho(M_0, M) = \sqrt{\Delta x_1^2 + \Delta x_2^2 + \dots + \Delta x_m^2}$  belgilashni kiritsak, u holda (22.6) formuladagi qoldiq had  $R_{n+1} = o(\rho^n)$  Peano ko‘rinishdagi qoldiq hadga ega bo‘ladi.

**22.6-misol.** Ushbu  $f(x, y) = x^3 - 2xy^2 + y^3 + 4x$  funksiyani  $A(1; -1)$  nuqta atrofida Teylor formulasi bo‘yicha yoying.

**Yechilishi.** Dastlab berilgan funksiyaning  $A(l; -1)$  nuqtadagi qiymatini hisoblaymiz:  $f(l; 1) = 1 - 2 - 1 + 4 = 2$ . Endi berilgan funksiyaning xususiy hosilalarini topib, ularning  $A(l; -1)$  nuqtadagi qiymatlarini hisoblaymiz:

$$\begin{aligned} f'_x(x, y) &= 3x^2 - 2y^2 + 4, \quad f'_x(l; -1) = 5; \\ f'_y(x, y) &= -4xy + 3y^2, \quad f'_y(l; -1) = 7; \\ f''_{xx}(x, y) &= 6x, \quad f''_{xx}(l, -1) = 6; \\ f''_{xy}(x, y) &= -4x + 6y, \quad f''_{xy}(l, -1) = -10; \\ f''_{yy}(x, y) &= -4y, \quad f''_{yy}(l, -1) = 4; \\ f''_{x^2}(x, y) &= 6, \quad f''_{x^2}(l, -1) = 6; \\ f''_{y^2}(x, y) &= 6, \quad f''_{y^2}(l, -1) = 6; \\ f''_{xy}(x, y) &= -4, \quad f''_{xy}(l, -1) = -4. \end{aligned}$$

Berilgan funksiyaning qolgan xususiy hosilalari nolga teng. Teylor formulasi bo'yicha quyidagi izlanayotgan yoyilmaga ega bo'lamiz:

$$\begin{aligned} f(x, y) &= 2 + 5(x-1) + 7(y+1) + 3(x-1)^2 + 4(x-1)(y+1) - 5(y+1)^2 + \\ &\quad + (x-1)^3 - 2(x-1)(y+1)^2 + (y+1)^3. \end{aligned}$$

### Mustaqil yechish uchun misollar

Quyidagi funksiyalarning ko'rsatilgan tartibdagi xususiy hosilalarini toping:

$$22.1. u = \sin xy, \frac{\partial^3 u}{\partial x^2 \partial y} = ?, \quad 22.2. u = x^4 \cos y + y^4 \cos x, \frac{\partial^8 u}{\partial x^4 \partial y^4} = ?$$

$$22.3. u = \sin x \cos 2y, \quad \frac{\partial^{10} u}{\partial x^4 \partial y^6} = ?, \quad 22.4. u = x^m y^n, \quad \frac{\partial^{m+n} u}{\partial x^m \partial y^n} = ?,$$

$$22.5. u = (x^2 + y^2)^{10} \operatorname{tg} x, \quad \frac{\partial^{10} u}{\partial x \partial y^9} = ?, \quad 22.6. u = \frac{x+y}{x-y}, \quad \frac{\partial^{m+n} u}{\partial x^m \partial y^n} = ?, \quad \frac{\partial^n u}{\partial y^n} = ?,$$

$$22.7. u = \ln \frac{1}{\sqrt{(x-\xi)^2 + (y-\eta)^2}}, \quad \frac{\partial^4 u}{\partial x \partial y \partial \xi \partial \eta} = ?$$

$$22.8. u = (x^2 + y^2)^m e^{x+y}, \quad \frac{\partial^{m+n} u}{\partial x^m \partial y^n} = ?, \quad 22.9.$$

$$u = f(x, y) = e^x \cdot \sin y, \quad f_{x^m y^n}^{(m+n)}(0, 0) = ?.$$

Quyidagi funksiyalarning ko'rsatilgan nuqtalardagi ikkinchi tartibili xususiy hosilalarini toping:

$$22.10. u = \frac{x}{x+y}, (1; 0).$$

$$22.11. u = y^2(1 - e^x), (0; 1).$$

$$22.12. \quad u = \ln(x^2 + y), (0;1)$$

$$22.13. \quad u = y \sin \frac{y}{x}, (2,\pi)$$

$$22.14. \quad u = \arcsin \frac{x}{\sqrt{x^2 + y^2}}, (1;-1)$$

$$22.15. \quad u = y + \frac{x}{y}, (1;1)$$

$$22.16. \quad u = x + xy - 5x^3 + \ln(x^2 + 1), (1;1)$$

$$22.17. \quad f(x,y) = \begin{cases} xy \frac{x^2 - y^2}{x^2 + y^2}, & (x,y) \neq (0,0) \text{ bo'lganda,} \\ 0, & (x,y) = (0,0) \text{ bo'lganda} \end{cases}$$

funksiya  $(0,0)$  nuqta uzluksiz ekanligi ma'lum (ko'rsating!). U holda, uning  $f_{xy}(0,0)$  va  $f_{yx}(0,0)$  xususiy hosilalarini toping:

Quyida berilgan  $f(x,y)$  funksiyaning ko'rsatilgan nuqtada ikkinchi tartibli differensialini toping:

$$22.18. \quad u = f(x,y) = e^{xy}, (1;-1)$$

$$22.19. \quad u = f(x,y) = \frac{x}{y} e^{x^2}, (0;1)$$

$$22.20. \quad u = f(x,y) = x \cos xy, \left(\frac{\pi}{2}; -1\right)$$

$$22.21. \quad u = f(x,y) = \operatorname{arctg}(x^2 - 2y), (1;0)$$

$$22.22. \quad u = (\sin x)^{\cos y}, \left(\frac{\pi}{6}; \frac{\pi}{2}\right)$$

$$22.23. \quad u = e^{xy}, (1, 1, 1)$$

Quyidagi funksiyalarning ko'rsatilgan tartibdagi differensial-larini toping.

$$22.24. \quad u = x^3 + y^3 - 3xy(x-y), d^3u = ? \quad 22.25. \quad u = \sin(x^2 + y^2), d^3u = ?$$

$$22.26. \quad u = \ln(x^2 y^2 z^2), d^4u = ?$$

$$22.27. \quad u = e^{ax+by}, d^n u = ?$$

$$22.28. \quad u = X(y) \cdot Y(y), d^n u = ?$$

$$22.29. \quad u = \sin x \operatorname{ch} y, \Delta u = \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} - ?$$

Quyidagi murakkab funksiyalarning birinchi va ikkinchi tartibli differensiallarini toping ( $x, y$  va  $z$  lar - erkli o'zgaruvchilar):

$$22.30. \quad u = f(t), t = x + y.$$

$$22.31. \quad u = f(t), t = \frac{y}{x}.$$

$$22.32. \quad u = f(\sqrt{x^2 + y^2}).$$

$$22.33. \quad u = f(t), t = x^2 + y^2 + z^2.$$

$$22.34. \quad u = f(\xi; \eta), \xi = ax, \eta = by.$$

$$22.35. \quad W = f(u, v), u = \frac{1}{2}(x^2 - y^2), v = xy.$$

$$22.36. \quad \text{Ushbu } u = \frac{1}{2a\sqrt{\pi t}} e^{\frac{(x-b)^2}{4a^2 t}} \text{ funksiyaning ushbu } \frac{\partial u}{\partial t} = a^2 \frac{\partial^2 u}{\partial x^2} \text{ issiqlik}$$

o'tkazuvchanlik tenglamasini qanoatlantirishini ko'rsating.

$$22.37. \quad \text{Ushbu } u = \frac{1}{r}, \quad r = \sqrt{(x-a)^2 + (y-b)^2 + (z-c)^2} \quad \text{funksiyaning, } r \neq 0$$

bo'lganda,  $\Delta u = \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2}$  Laplas tenglamasini qanoatlantirishini isbotlang.

**22.38.** Ushbu  $u = \frac{c_1 e^{-ar} + c_2 e^{ar}}{r}$  funksiya, bunda  $r = \sqrt{x^2 + y^2 + z^2}$ ,  $c_1, c_2$  o'zgarmas sonlar, quyidagi  $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2} = Cu$  Gel'mgol's tenglamasini qanoatlantirishini isbotlang.

**22.39.** Ushbu  $u(t, x) = \frac{1}{\sqrt{t}} e^{(x^2)/(4t)}$  funksiyaning  $t \frac{\partial u}{\partial t} + \frac{\partial^2 u}{\partial x^2} = 0$

Shryodinger tenglamasini qanoatlantirishini isbotlang.

**22.40.**  $f - r$  argumentning ikki marta differensiallanuvchi funksiyasi, bunda  $r = \sqrt{x^2 + y^2 + z^2}$ , bo'lsin va  $f_{xx} + f_{yy} + f_{zz} = 0$  munosabat o'rini bo'lsin. U holda, qandaydir  $a$  va  $b$  o'zgarmaslar uchun,  $f(r) = \frac{a}{r} + b$  ekanligini ko'rsating.

Quyidagi ixtiyoriy  $\varphi, \psi$  va hokazo funksiyalarni istalgan marta differensiallanuvchi, deb faraz qilib, quyida berilgan tengliklarni tekshiring:

$$22.41. y \frac{\partial z}{\partial x} - x \frac{\partial z}{\partial y} = 0, \quad z = \varphi(x^2 + y^2).$$

$$22.42. x^2 \frac{\partial z}{\partial x} - xy \frac{\partial z}{\partial y} + y^2 = 0, \quad z = \frac{y^2}{3x} + \varphi(xy).$$

$$22.43. \frac{x \partial u}{\partial x} + \alpha y \frac{\partial u}{\partial y} + \beta z \frac{\partial u}{\partial z} = nu, \quad u = x^\alpha \varphi\left(\frac{y}{x^\alpha}, \frac{z}{x^\beta}\right).$$

$$22.44. \frac{\partial^2 u}{\partial t^2} = a^2 \frac{\partial^2 u}{\partial x^2}, \quad u = \varphi(x - at + \varphi(x + at)).$$

$$22.45. x^2 \frac{\partial^2 u}{\partial x^2} + 2xy \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial y^2} = n(n-1)u, \quad u = x^n \varphi\left(\frac{y}{x}\right) + x^{1-n} \psi\left(\frac{y}{x}\right).$$

Berilgan  $f(x, y)$  funksiyani berilgan nuqta atrofida Teylor formulasi bo'yicha yoying:

$$22.46. f(x, y) = x^2 - 3xy + y^2 - 4x + 5y, \quad A(1; 1).$$

$$22.47. f(x, y) = -x^2 + 2xy + 3y^2 - 6x - 2y - 4, \quad A(-2; 1).$$

$$22.48. f(x, y) = x^3 + 3xy - 2y^3, \quad A(1; 2).$$

$$22.49. f(x, y) = x^3 - 5x^2 - xy + y^2 + 10x + 5y, \quad A(2; -1).$$

Berilgan  $f(x, y)$  funksiyani berilgan nuqta atrofida Teylor formulasining uchinchi ( $n = 3$ ) hadigacha yoying:

$$22.50. f(x, y) = \sqrt{1 - x^2 - y^2}, \quad O(0, 0). \quad 22.51. f(x, y) = x^y, \quad A(1; 1).$$

Quyida berilgan funksiyalarni Teylor formulasi bo'yicha ikkinchi hadigacha ( $n = 2$ ) yoying:

$$22.52. f(x, y) = \frac{1}{x-y}. \quad 22.53. f(x, y) = \sqrt{x+y}. \quad 22.54. f(x, y) = e^{x+y}.$$

**22.55.**  $f(x, y) = x^3 + 2y^3 - xy$  funksiya berilgan.  $f(x+h, y+k)$  funksiyani  $h$  va  $k$  ning darajalari bo'yicha ikkinchi hadgacha Teylor formulasiga yoying.

**22.56.** 2)  $f(x, y) = e^x \sin y$  funksiya berilgan.  $f(x+h, y+k)$  funksiyani  $h$  va  $k$  ning darajalari bo'yicha uchinchi hadgacha Teylor formulasiga yoying. Bu natijadan foydalanim  $e^{0,1} \sin 0,49\pi$  ning qiymatini hisoblang.

Berilgan  $f(x, y, z)$  funksiyani berilgan nuqta atrofida Teylor formulasiga yoying:

$$22.57. f(x, y, z) = (x+y+z)^2, (1; 1; -2).$$

$$22.58. f(x, y, z) = x^2 + 3z^2 - 2yz - 3z, (0; 1; 2).$$

$$22.59. f(x, y, z) = xyz, (1; 2; 3).$$

$$22.60. f(x, y, z) = x^3 + y^3 + z^3 - 3xyz, (1; 0; 1).$$

$$22.61. f(x, y, z) = x^2 + y^2 + z^2 - 2(xy + xz + yz), (1; -1; 2).$$

Quyida berilgan funksiyalarni Makloren formulasi bo'yicha uchinchi hadgacha ( $n=3$ ) yoying:

$$22.62. f(x, y) = e^y \cos x.$$

$$22.63. f(x, y) = \sin x \cdot \sin y.$$

**22.64.**  $f(x, y) = n$  darajali birjinsli funksiya, ya'ni barcha  $t, x$  va  $y$  lar hamda  $n$ -nomanfiy butun son uchun:

$$f(tx, ty) = t^n f(x, y)$$

munosabat o'rinni, bo'lsin. Bunday funksiya uchun,

$$a) x \frac{\partial f}{\partial x} + y \frac{\partial f}{\partial y} = nf(x, y); \quad b) x^2 \left( \frac{\partial^2 f}{\partial x^2} \right) + 2xy \left( \frac{\partial^2 f}{\partial x \partial y} \right) + y^2 \left( \frac{\partial^2 f}{\partial y^2} \right) = n(n-1)f(x, y)$$

munosabatlar bajarilishini isbotlang.

$$22.25. d^3 u = -8(xdx + ydy)^3 \cos(x^2 + y^2) - .$$

$$-12(xdx + ydy)(dx^2 + dy^2) \sin(x^2 + y^2) \quad 22.26. d^4 u = 2\left(\frac{dx^4}{x^3} + \frac{dy^4}{y^3} + \frac{dz^4}{z^3}\right).$$

$$22.27. d^n u = e^{ax+by}(adx + bdy)^n. \quad 22.28. d^n u = \sum_{k=0}^n C_n^k X^{(n-k)}(x) Y^{(k)}(y) dx^{n-k} dy^k.$$

$$22.29. \Delta u = 0. \quad 22.30. du = f'(t)(dx + dy), \quad d^2 u = f''(t)(dx + dy)^2.$$

$$22.31. du = f'(t) \frac{x dy - y dx}{x^2}, \quad d^2 u = f''(t) \frac{(xdy - ydx)^2}{x^4} - 2f'(t) \frac{dx(xdy - ydx)}{x^3}.$$

$$22.32. du = f' \cdot \frac{xdx + ydy}{\sqrt{x^2 + y^2}}, \quad d^2 u = f' \frac{(xdx + ydy)^2}{x^2 + y^2} + f' \frac{(ydx - xdy)^2}{(x^2 + y^2)^{3/2}}.$$

$$22.33. du = 2f'(t)[xdx + ydy + zdz],$$

$$d^2 u = 4f'(t)[xdx + ydy + zdz] + 2f'(t)[dx^2 + dy^2 + dz^2].$$

$$22.34. du = df_\xi \cdot dx + bf_\eta \cdot dy, \quad d^2 u = a^2 f_{\xi\xi} dx^2 + 2abf_{\xi\eta} dx^2 + b^2 f_{\eta\eta} dy^2.$$

$$22.35. dW = (xf'_v + yf'_v)dx + (xf'_w + yf'_w)dy, \quad d^2 W = [x^2 \cdot f'_{ww} + 2xy \cdot f'_{vw} + y^2 \cdot f'_{ww} + f'_v] dx^2 + [2(xy \cdot f'_{vw} + (x^2 - y^2) \cdot f'_{ww} - xy \cdot f'_{ww} + f'_v)] dxdy + [y^2 \cdot f'_{ww} - 2xy \cdot f'_{vw} + x^2 \cdot f'_{vw} - f'_w] dy^2.$$

$$22.46. f(x, y) = -5(x-1) + 4(y-1) + (x-1)^2 - 3(x-1)(y-1) + (y-1)^2.$$

$$22.47. f(x, y) = 1 - (x+2)^2 - 2(x+2)(y-1) + 3(y-1)^2.$$

$$22.48. f(x, y) = -9 + 9(x-1) - 21(y-2) + 3(x-1)^2 + 3(x-1)(y-2) - 12(y-1)^2 + (x-1)^3 - 2(y-2)^3.$$

$$22.49. f(x, y) = 6 + 3(x-2) + (y+1) + (x-2)^2 - (x-2)(y+1) + (y+1)^2 +$$

$$+ (x-2)^3. \quad 22.50. f(x, y) \approx 1 - \frac{1}{2}(\Delta x^2 + \Delta y^2) + R_3.$$

$$22.51. f(x, y) = 1 + \Delta x + \Delta x \Delta y + \frac{1}{2} \Delta x^2 \Delta y + R,$$

$$22.52. \Delta z = \frac{\Delta y - \Delta x}{(x-y)^2} + \frac{\Delta x^2 + 2\Delta x \Delta y + \Delta y^2}{(x-y)^2} + R_2,$$

$$22.53. \Delta z = \frac{\Delta x + \Delta y}{2\sqrt{x+y}} + \frac{\Delta x^2 + 2\Delta x \Delta y + \Delta y^2}{8(x+y)^{3/2}} + R_2,$$

$$22.54. \Delta z = e^{x+y} (\Delta x + \Delta y) + e^{x+y} \frac{(\Delta x + \Delta y)^2}{2} + R_2.$$

$$22.55. x^3 + 2y^3 - xy + h(3x^2 - y) + k(6y^2 - x) + 3xh^2 - hk + + 6yk^2 + h^3 + 2k^3.$$

$$22.56. f(x+h, y+k) \approx f(x, y) + e^x [\sin y + h \sin y + k \cos y + \\ + \frac{1}{2}(h^2 \sin y + 2hk \cos y - k^2 \sin y) + \frac{1}{6}(h^3 \sin y + 3h^2 k \cos y - 3hk^2 \sin y - k^3 \cos y)] + R_3,$$

$$f(0.1; 0.49\pi) \approx 1.1051.$$

$$22.57. f(x, y, z) = (x-1)^2 + (y-1)^2 + (z+2)^2 + 2(x-1)(y-1) + \\ + 2(x-1)(z+2) + 2(y-1)(z+2).$$

$$22.58. f(x, y, z) = 2 - 4(y-1) + 7(z-2) + x^2 + 3(z-2)^2 - - 2(y-1)(z-2).$$

$$22.59. f(x, y, z) = 6 + 6(x-1) + 3(y-2) + 2(z-3) + 3(x-1)(y-2) + \\ + 2(x-1)(z-3) + (y-2)(z-3) + (x-1)(y-2)(z-3).$$

$$22.60. f(x, y, z) = 2 + 3(x-1) - 3y + \\ 3(z-1) + 3(x-1)^2 + 3(z-1)^2 - 3(x-1)y - 3y(z-1) + (x-1)^3 + y^3 + (z-1)^3 - 3(x-1)y(z-1).$$

$$22.61. f(x, y, z) = 8 - 8(y+1) + 4(z-2) + (x-1)^2 + (y+1)^2 + (z-2)^2 - 2(x-1)(y+1) - \\ - 2(x-1)(z-2) - 2(y+1)(z-2). 22.62. f(x, y) = 1 + y + \frac{1}{2}(y^2 - x^2) + \frac{1}{3}(y^3 - 3x^2 y) + o(\rho^3),$$

$$\rho = \sqrt{x^2 + y^2}. 22.63. f(x, y) = xy + \frac{1}{3!}(xy^3 - x^3 y) + o(\rho^4), \rho = \sqrt{x^2 + y^2}.$$

### 23-§. Ko‘p o‘zgaruvchili funksiyaning ekstremumlari

#### 23.1. Funksiyaning maksimum va minimum qiyatlari.

$u = f(x_1, x_2, \dots, x_m) = f(M)$  funksiya ochiq  $\{M\}$  ( $\{M\} \subset R^m$ ) to‘plamda berilgan bo‘lib,  $M_0(x_1^0, x_2^0, \dots, x_m^0) \in \{M\}$  bo‘lsin.

**23.1-ta’rif.** Agar  $M_0$  nuqtaning shunday

$$U_\delta(M_0) = \left\{ M \in \{M\}: p(M, M_0) = \sqrt{(x_1 - x_1^0)^2 + \dots + (x_m - x_m^0)^2} < \delta \right\} \subset \{M\}$$

atrofi mavjud bo‘lib,  $\forall M \in U_\delta(M_0)$  uchun  $f(M) \leq f(M_0)$  ( $f(M) \geq f(M_0)$ ) tengsizlik bajarilsa,  $f(M)$  funksiya  $M_0$  nuqtada maksimumga (minimumga) ega deyiladi.  $f(M_0)$  qiymat esa,  $f(M)$  funksiyaning

*maksimum (minimum) qiymati yoki maksimumi (minimumi)* deyiladi va u,  $f(M_0) = \max_{M \in U_\delta(M_0)} \{f(M)\}$   $\left( f(M_0) = \max_{M \in U_\delta(M_0)} \{f(M)\} \right)$  kabi belgilanadi.

**23.2-ta'rif.** Agar  $M_0$  nuqtaning shunday  $U_\delta(M_0)$  atrofi mavjud bo'lib,  $\forall M \in U_\delta(M_0) / \{M_0\}$  uchun  $f(M) < f(M_0)$  ( $f(M) > f(M_0)$ ) tenglik bajarilsa,  $f(M)$  funksiya  $M_0$  nuqtada *qa'tiy maksimumiga* (*qa'tiy minimumga*) ega deyiladi,  $f(M_0)$  qiymatga esa,  $f(M)$  funksiyaning *qa'tiy maksimum* (*qa'tiy minimum*) *qiymati* yoki *qa'tiy maksimumi* (*qa'tiy minimumi*) deyiladi.

Funksiyaning *maksimumi* va *minimumi*, *umumiyl nom bilan, uning ekstremumi deb yuritiladi.*

23.1. va 23.2 - ta'riflardagi  $M_0$  nuqta  $f(M)$  funksiyaga *maksimum (minimum)*, *qa'tiy maksimum (qa'tiy minimum)* *qiymat beradigan nuqta* deyiladi. 23.1. va 23.2-ta'riflardan ko'rindiki,  $f(M)$  funksiyaning  $M_0$  nuqtadagi  $f(M_0)$  qiymati, uning shu nuqta atrofidagi nuqtalardagi qiymatlari bilan solishtirilar ekan. Shuning uchun, funksiyaning  $M_0$  nuqtadagi ekstremumi, *lokal ekstremum* deb yuritiladi.

**Misol. Quyidagi**

$$1) u = x^2 + y^2; \quad 2) u = |x - y|; \quad 3) u = \sqrt{1 - x^2 - y^2}$$

funksiyalarni qaraymiz. Ravshanki,  $M_0(0;0)$  nuqta: 1) funksiya uchun *qa'tiy minimum*; 2) funksiya uchun, *minimum*; 3) funksiya uchun esa, *qa'tiy maksimum* nuqtasi bo'ladi. Haqiqatan ham,  $M_0(0;0)$  nuqtaning shunday  $U_r(0;0) = \{(x, y) \in R^2 : x^2 + y^2 < r^2\}$  ( $0 < r < 1$ ) atrofini qaraylik. Bu atrofdan olingan  $\forall M(x, y) \in U_r(0;0) / \{0;0\}$  uchun,  $u = \sqrt{1 - x^2 - y^2} < u(0;0) = 1$  bo'ladi.

**23.2. Funksiya ekstremumining zaruriy sharti.**  $u = f(x_1, x_2, \dots, x_n) = f(M)$  funksiya ochiq  $\{M\} (\{M\} \subset R^n)$  to'plamda aniqlangan bo'lsin.

**23.1 - teorema (ekstremumning zaruriy sharti).** Agar  $f(M)$  funksiya  $M_0$  nuqtada ekstremumga ega bo'lib, shu nuqtada barcha  $f'_{x_1}, f'_{x_2}, \dots, f'_{x_n}$  xususiy hosilalarga ega bo'lsa, u holda,  $f'_{x_1}(M_0) = 0, f'_{x_2}(M_0) = 0, \dots, f'_{x_n}(M_0) = 0$  bo'ladi.

**23.1-eslatma.**  $f(M)$  funksiyaning biror  $M'$  nuqtada barcha  $f'_{x_1}, f'_{x_2}, \dots, f'_{x_n}$  xususiy hosilalarga ega va  $f'_{x_1}(M') = 0, f'_{x_2}(M') = 0, \dots, f'_{x_n}(M') = 0$

bo'lishidan, uning shu  $M'$  nuqtada ekstremumga ega bo'lishi har doim ham kelib chiqavermaydi.

Masalan,  $u = f(x, y) = xy$  funksiya  $R^m$  to'plamda aniqlangan bo'lib,  $\frac{\partial u}{\partial x} = y$ ,  $\frac{\partial u}{\partial y} = x$  xususiy hosilalarga ega va ular  $M_0(0;0)$  nuqtada nolga aylanadi. Ammo, bu funksiya  $M_0(0;0)$  nuqtada nolga aylanadi,  $\forall U_\delta(0,0)$  atrofda esa, musbat va manfiy qiyatlar qabul qiladi.

Demak, 23.1-teorema funksiya ekstremumga ega bo'lishining zaruriy shartini ifodalar ekan.  $u = f(M)$  funksiyaning birinchi tartibili xususiy hosilalarini nulga aylantiruvchi nuqtalarga *stasionar nuqtalar* deyiladi. Stasionar nuqtalarda funksiya ekstremumga ega bo'lishi ham, ega bo'lmasligi ham mumkin.

**23.2-eslatma.** Agar  $f(M)$  funksiya  $M_0$  nuqtada differensialanuvchi bo'lsa, u holda funksiya ekstremumga ega bo'lishining zaruriy shartini,  $d(f(M_0)) = 0$  ko'rinishda ham yozish mumkin.

### 23.1-misol. Ushbu

$$u = f(x, y) = \sqrt{x^2 + y^2}$$

funksiya  $M_0(0;0)$  nuqtada ekstremumga ega bo'ladimi?

**Yechilishi.** Berilgan funksiya  $M_0(0;0)$  nuqtada nolga aylanadi.  $M_0(0;0)$  nuqtaning ixtiyoriy  $U_\delta(M_0) = \{(x, y) \in R^2 : x^2 + y^2 < \delta\}$  ( $\delta > 0$ ) atrofini qaraymiz. Unda  $\forall M(x, y) \in U_\delta(M_0)$  uchun  $f(x, y) = \sqrt{x^2 + y^2} \geq f(0;0) = 0$  bo'ladi.

Demak, berilgan funksiya  $M_0(0;0)$  nuqtada minimumga ega va  $\min\{f(x, y)\} = 0$  bo'ladi. Lekin,  $f(x, y) = \sqrt{x^2 + y^2}$  funksiya  $M_0(0;0)$  nuqtada xususiy hosilalarga ega emas. Shunday qilib,  $u = f(x_1, x_2, \dots, x_m)$  funksiya, ochiq  $\{M\} \subset R^m$  to'plamning: 1) barcha xususiy hosilalar nolga aylanadigan, ya'ni  $\frac{\partial u}{\partial x_1} = 0, \frac{\partial u}{\partial x_2} = 0, \dots, \frac{\partial u}{\partial x_m} = 0$  tenglamalarni qanoatlantiradigan nuqtalarida;

2) xususiy hosilalar mavjud bo'lмаган nuqtalarida ekstremumga erishishi mumkin.

**23.3. Funksiya ekstremumining etarli sharti.** **23.3.1. Kvadratik forma to'g'risida qisqacha ma'lumot.** Kvadratik formalar algebra kursida bat afsil o'r ganilsa-da, biz, kelgusida qo'llaniladigan, kvadratik formaga oid ba'zi bir tushunchalarni keltirib o'tamiz. Ushbu,

$$Q(x_1, x_2, \dots, x_m) = a_{00}x_1^2 + a_{10}x_1x_2 + \dots + a_{1m}x_1x_m + a_{21}x_2x_1 + a_{22}x_2^2 + \dots + a_{mm}x_m^2$$

(yoki  $Q = \sum_{i,j=1}^m a_{ij} x_i x_j$ ) ifodaga,  $x_1, x_2, \dots, x_m$  o'zgaruvchilarning kvadratik formasi deyiladi, bunda  $a_{ik}$  ( $a_{ij} = a_{ji}$ ) lar - kvadratik formaning koeffitsiyentlari deyiladi. Bu koeffisientlardan tuzilgan,

$$A = \begin{pmatrix} a_{11} & a_{12} & \dots & a_{1m} \\ a_{21} & a_{22} & \dots & a_{2m} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \dots & a_{mm} \end{pmatrix}$$

matrisaga - kvadratik formaning matrisasi deyiladi. Ushbu

$$\delta_1 = a_{11}, \quad \delta_2 = \begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix}, \quad \delta_k = \begin{vmatrix} a_{11} & \dots & a_{1k} \\ \vdots & \ddots & \vdots \\ a_{k1} & \dots & a_{kk} \end{vmatrix}, \quad \delta_m = \begin{vmatrix} a_{11} & \dots & a_{1m} \\ a_{21} & \dots & a_{2m} \\ \vdots & \ddots & \vdots \\ a_{m1} & \dots & a_{mm} \end{vmatrix}$$

determinantlarga esa,  $A$  matrisaning minorlari deyiladi. Ravshanki,  $x_1 = x_2 = \dots = x_m = 0$  bo'lganda har qanday kvadratik forma uchun,  $Q(0, \dots, 0) = 0$  bo'ladi. Endi boshqa nuqtalarni qaraylik. Bunda quyidagi hollar bo'lishi mumkin:

1. Barcha  $x_1^2 + x_2^2 + \dots + x_m^2 > 0$  nuqtalar uchun,  $Q(x_1, x_2, \dots, x_m) > 0$  bo'lsa, bu holda kvadratik forma musbat aniqlangan deyiladi.

2. Barcha  $x_1^2 + x_2^2 + \dots + x_m^2 > 0$  nuqtalar uchun,  $Q(x_1, x_2, \dots, x_m) < 0$  bo'lsa, bu holda kvadratik forma manfiy aniqlangan deyiladi.

3. Ba'zi  $(x_1, x_2, \dots, x_m)$  nuqtalar uchun,  $Q(x_1, x_2, \dots, x_m) > 0$ , ba'zi  $(x_1, x_2, \dots, x_m)$  nuqtalar uchun esa,  $Q(x_1, x_2, \dots, x_m) < 0$  bo'lsa, bu holda kvadratik forma noaniq (aniqlanmagan) deyiladi.

4. Barcha  $x_1^2 + x_2^2 + \dots + x_m^2 > 0$  nuqtalar uchun,  $Q(x_1, x_2, \dots, x_m) \geq 0$  va ular orasida,  $Q(x_1, x_2, \dots, x_m) = 0$  bo'ladigan  $(x_1, x_2, \dots, x_m)$  nuqtalar ham bor bo'lsa, kvadratik forma - yarim musbat aniqlangan deyiladi.

5. Barcha  $x_1^2 + x_2^2 + \dots + x_m^2 > 0$  nuqtalar uchun,  $Q(x_1, x_2, \dots, x_m) \leq 0$  va ular orasida,  $Q(x_1, x_2, \dots, x_m) = 0$  bo'ladigan  $(x_1, x_2, \dots, x_m)$  nuqtalar ham bor bo'lsa, kvadratik forma - yarim manfiy aniqlangan deyiladi.

Silvestr alomati.  $Q(x_1, x_2, \dots, x_m) = \sum_{i,k=1}^m a_{ik} x_i x_k$  kvadratik formaning musbat aniqlangan bo'lishi uchun,  $\delta_1 > 0, \delta_2 > 0, \dots, \delta_m > 0$  tengsizliklarning; manfiy aniqlangan bo'lishi uchun,  $\delta_1 < 0, \delta_2 > 0, \delta_3 < 0, \delta_4 > 0, \dots, (-1)^m \delta_m > 0$  tengsizliklarning bajarilishi zarur va yetarli.

Funksiya ikki o'zgaruvchiga bog'liq bo'lgan xususiy holni qaraymiz.

$u = f(x, y)$  funksiya  $M_0(x_0, y_0)$  nuqtaning biror  $U_\delta(M_0) = \{(x, y) \in R^2 : p(M, M_0) < \delta\}$  ( $\delta > 0$ ) atrofida aniqlangan, u barcha birinchi va ikkinchi tartibli uzlusiz xususiy hosilalarga ega bo'lib,  $M_0$  nuqta  $u = f(M)$  funksiyaning stasionar nuqtasi, ya'ni

$$f'_x(M_0) = 0, f'_y(M_0) = 0$$

bo'lsin.  $a_{11} = f''_{x^2}(M_0)$ ,  $a_{12} = f''_{xy}(M_0)$ ,  $a_{21} = f''_{yx}(M_0)$  deb belgilaymiz.

1<sup>0</sup>. Agar  $\begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix} = a_{11}a_{22} - a_{12}^2 > 0$  va  $a_{11} > 0$  bo'lsa,  $f(M)$  funksiya  $M_0$

nuqtada minimumga erishadi.

2<sup>0</sup>. Agar  $a_{11}a_{22} - a_{12}^2 > 0$  va  $a_{11} < 0$  bo'lsa,  $f(M)$  funksiya  $M_0$  nuqtada maksimumga erishadi.

3<sup>0</sup>. Agar  $a_{11}a_{22} - a_{12}^2 < 0$  bo'lsa,  $f(M)$  funksiya  $M_0$  nuqtada ekstremumga erishmaydi.

4<sup>0</sup>. Agar  $a_{11}a_{22} - a_{12}^2 = 0$  bo'lsa,  $f(M)$  funksiya  $M_0$  nuqtada ekstremumga erishishi ham mumkin, erishmasligi ham mumkin.

**23.3-teorema (shartsiz ekstremumning yetarli sharti).**  $f(M)$  funksiya  $M_0(x_1^0, x_2^0, \dots, x_n^0)$  nuqtaning biror atrofida ikkinchi tartibli uzlusiz xususiy hosilalarga ega va  $M_0(x_1^0, x_2^0, \dots, x_n^0)$  nuqta -  $f(M)$  funksiyaning stasionar nuqtasi bo'lsin. U holda:

1) agar

$$B(dx_1, dx_2, \dots, dx_n) = \sum_{k=1}^n \sum_{j=1}^n \frac{\partial^2 f(M_0)}{\partial x_k \partial x_j} dx_k dx_j$$

kvadratik forma, ya'ni  $f(M)$  funksiyaning  $M_0(x_1^0, x_2^0, \dots, x_n^0)$  nuqtadagi ikkinchi tartibli differensiali  $B(dx_1, dx_2, \dots, dx_n) = d^2 f(M_0)$  musbat (manfiy) aniqlangan bo'lsa,  $M_0(x_1^0, x_2^0, \dots, x_n^0)$  nuqta -  $f(M)$  funksiyaning minimum (maksimum) nuqtasi bo'ldi.

2) agar  $B(dx_1, dx_2, \dots, dx_n)$  kvadratik forma aniqlanmagan bo'lsa (ham musbat, ham manfiy qiymatlar qabul qilsa),  $M_0(x_1^0, x_2^0, \dots, x_n^0)$  nuqta -  $f(M)$  funksiyaning ekstremum nuqtasi bo'lmaydi.

**23.2-misol.** Quyidagi

$$a) u = x^2 - xy + y^2; b) u = x^2 - xy - y^2$$

funksiyalarni ekstremumga tekshiring.

**Yechilishi.** a) Berilgan funksiyaning xususiy hosilalarini topamiz va nulga tenglashtiramiz.  $u'_x = 2x - y = 0$ ,  $u'_y = -x + 2y = 0$ . Bu sistemani yechib, ekstremumga shubhali,  $M_0(0;0)$  nuqtani topamiz. Endi ikkinchi

tartibli xususiy hosilalarni topamiz:  $a_{11} = u_{x^2}^* = 2$ ;  $a_{12} = u_{xy}^* = -1$ ;  $a_{22} = u_{y^2}^* = 2$ . Bu xususiy hosilalarning  $M_0(0;0)$  nuqtadagi qiymatlarni hisoblaymiz:

$$u_{x^2}^*(M_0) = 2, u_{xy}^*(M_0) = -1, u_{y^2}^*(M_0) = 2$$

Shunday qilib,  $a_{11}a_{22} - a_{12}^2 = 2 \cdot 2 - (-1)^2 = 4 - 1 = 3 > 0$ ,  $a_{11} = 2 > 0$ .

Demak, Silvestr alomatining  $1^0$  - shartiga asosan, funksiya  $M_0(0;0)$  nuqtada minimumga erishadi, ya'ni  $U_{\min}(0;0) = U(0;0) = 0$ .

*Misolni Maple tizimidan foydalanib yechish:*

> readlib(extrema);

> extrema(x^2-x\*y+y^2,{},{x,y},'z');z;

{0}

{y=0, x=0};

b) Xuddi a) banddag'i singari,  $u_x^* = 2x - y$ ,  $u_y^* = -x - 2y$  xususiy hosilalarni topib, ularni nulga tenglashtiramiz:

$u_x^* = 2x - y = 0$ ,  $u_y^* = -x - 2y = 0$ . Bu sistemani Yechib,  $M_0(0;0)$  stasionar nuqtani, ya'ni ekstremumga shubhali nuqtani topamiz.

Ikkinchi tartibli xususiy hosilalarni topib, ularning  $M_0(0;0)$  stasionar nuqtadagi qiymatlarini hisoblaymiz:  $a_{11} = u_{x^2}^* = 2$ ;  $a_{12} = u_{xy}^* = -1$ ;

$a_{22} = u_{y^2}^* = -2$ . Unda  $a_{11}a_{22} - a_{12}^2 = 2 \cdot (-2) - (-1)^2 = -4 - 1 = -5 < 0$ .

Demak, Silvestr alomatining  $3^0$  - shartiga asosan, funksiya  $M_0(0;0)$  nuqtada ekstremumga erishmaydi.

**23.3-misol.** Ushbu  $u = x^2 + 2y^2 + z^2 - 2x + 4y - 6z + 1$  funksiyani ekstremumga tekshiring.

**Yechilishi.** Berilgan funksiyaning xususiy hosilalarini topib, ularni nulga tenglashtiramiz:  $u_x^* = 2x - 2 = 0$ ,  $u_y^* = 4y + 4 = 0$ ,  $u_z^* = 2z - 6 = 0$ . Bu sistemani Yechib,  $M_0(1;-1;3)$  stasionar nuqtani topamiz.

Endi ikkinchi tartibli xususiy hosilalarni topib, ularning  $M_0(1;-1;3)$  stasionar nuqtadagi qiymatlarini hisoblaymiz:

$$u_{x^2}^*(M_0) = 2, u_{xy}^*(M_0) = 0, u_{yz}^*(M_0) = 0, u_{zx}^*(M_0) = 0, u_{xx}^*(M_0) = 0,$$

$$u_{yy}^*(M_0) = 4, u_{xz}^*(M_0) = 0, u_{yz}^*(M_0) = 0, u_{zz}^*(M_0) = 0.$$

Unda

$$\delta_1 = a_{11} = 2 > 0, \delta_2 = \begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix} = \begin{vmatrix} 2 & 0 \\ 0 & 4 \end{vmatrix} = 8 > 0, \delta_3 = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} = \begin{vmatrix} 2 & 0 & 0 \\ 0 & 4 & 0 \\ 0 & 0 & 2 \end{vmatrix} = 16 > 0$$

bo'ldi.

Demak,  $\delta_1 > 0$ ,  $\delta_2 > 0$ ,  $\delta_3 > 0$ . Shunday qilib, Silvestr alomatiga asosan,  $M_0(1;-1,3)$  nuqtada funksiya minimumga erishadi:  $U_{\min} = u(1;-1,3) = -11$ .

### 23.4. Ko'p o'zgaruvchili funksiyaning shartli ekstremumi.

Bizga biror ochiq  $G$  ( $G \subset R^n$ ) to'plamda aniqlangan,  $n$  o'zgaruvchili

$$z = f(x_1, x_2, \dots, x_n) = f(M) \quad (23.1)$$

funksiya berilgan bo'lib, uning  $x_1, x_2, \dots, x_n$  argumentlari o'zaror ushbu

$$\left. \begin{array}{l} \varphi_1(x_1, x_2, \dots, x_n) = 0 \\ \varphi_2(x_1, x_2, \dots, x_n) = 0 \\ \cdots \\ \varphi_m(x_1, x_2, \dots, x_n) = 0 \end{array} \right\} \quad (23.2)$$

qo'shimcha munosabatlar bilan bog'langan bo'lsin ( $m < n$ ).

(23.2) tenglamalar sistemasi — bog'lanishlar tenglamalari yoki bog'lanishlar deyiladi. Koordinatalari (23.2) sistemani qanoatlantiradigan nuqtalar to'plamini  $E$  ( $E \subset G$ ) orqali belgilaymiz.

**23.3-ta'rif.** Agar  $M_0$  ( $M_0 \in E$ ) nuqtaning shunday  $U(M_0)$  atrofi mavjud bo'lib,  $E \cap U(M_0)$  to'plamdan olingan  $\forall M$  nuqtalar uchun,

$$f(M) \leq f(M_0) \quad (f(M) \geq f(M_0))$$

tengsizlik bajarilsa,  $M_0 \in E$  nuqta,  $f(M)$  funksiyaning, (23.2) bog'lanishlarga nisbatan, *shartli maksimum (minimum) nuqtasi* deyiladi.

**23.4-ta'rif.** Agar  $M_0$  ( $M_0 \in E$ ) nuqtaning shunday  $U(M_0)$  atrofi mavjud bo'lib,  $E \cap U(M_0)$  to'plamdan olingan  $\forall M$  nuqtalar uchun

$$f(M) < f(M_0) \quad (f(M) > f(M_0))$$

tengsizlik bajarilsa,  $M_0 \in E$  nuqta  $f(M)$  funksiyaning, (23.2) bog'lanishlarga nisbatan, *shartli qat'iy maksimum (minimum) nuqtasi* deyiladi.

Bu yerda ham, shartli maksimum va shartli minimum, umumiy nom bilan, *shartli ekstremum* deb yuritiladi.

Boshqacha aytganda, *shartli maksimum (minimum)* - funksiyaning,  $M_0$  ( $M_0 \in E$ ) nuqtaning  $U(M_0)$  atrofdagi barcha nuqtalarga nisbatan emas, balki,  $U(M_0)$  atrofdagi (23.2) sistemani qanoatlantiradigan nuqtalarga nisbatan  $M_0$  nuqtadagi eng katta (eng kichik) qiymatidan iboratdir.

Masalan,  $u = f(x, y) = xy$  funksiya  $\varphi(x, y) = y - x = 0$  bog'lanishga nisbatan  $O(0,0)$  nuqtada shartli qat'iy minimumga ega, chunki  $f(0,0) = 0$ ,

ammo  $y - x = 0$  tenglamani qanoatlantiradigan  $(\varepsilon, \varepsilon)$ ,  $\varepsilon \neq 0$ , nuqtalarda funksiyaning qiymatlari musbat:  $f(\varepsilon, \varepsilon) = \varepsilon^2 > 0$ .

Shartli ekstremumni topish haqidagi masalani Yechishning ikkita usulini qaraymiz.

**23.4.1. O'zgaruvchilarning bir qismini yo'qotish usuli.** Faraz qilaylik,  $M_0$  ( $M_0 \in E$ ) nuqtaning biror  $\omega = U(M_0)$  atrofida: 1)  $f(M)$  funksiya va (2) sistemadagi  $\varphi_i(x), i = \overline{1, m}$  funksiyalar differensiallanuvchi; 2)  $\frac{\partial \varphi_i}{\partial x_j}, (i = \overline{1, m}; j = \overline{1, n})$  xususiy hosilalari  $M_0$  nuqtada uzlucksiz; 3) ushbu

$$\begin{vmatrix} \frac{\partial \varphi_1}{\partial x_1} & \frac{\partial \varphi_1}{\partial x_2} & \cdots & \frac{\partial \varphi_1}{\partial x_n} \\ \frac{\partial \varphi_2}{\partial x_1} & \frac{\partial \varphi_2}{\partial x_2} & \cdots & \frac{\partial \varphi_2}{\partial x_n} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial \varphi_m}{\partial x_1} & \frac{\partial \varphi_m}{\partial x_2} & \cdots & \frac{\partial \varphi_m}{\partial x_n} \end{vmatrix} \quad (23.3)$$

matrisaning birorta  $m$ -tartibli minori  $M_0$  nuqtada noldan farqli bo'lsin.

Masalan,  $\frac{D(\varphi_1, \varphi_2, \dots, \varphi_m)}{D(x_1, x_2, \dots, x_n)} \neq 0$ , ya'ni (23.3) matrisaning  $M_0$  nuqtada rangi  $m$  ga teng bo'lsin. U holda,  $M_0$  nuqtaning kichik atrofi,  $Q \subset \omega = U(M_0)$  parallelepipedda, (23.2) sistema, qandaydir  $m$  ta o'zgaruvchilarga, masalan,  $x_1, x_2, \dots, x_m$  o'zgaruvchilarga nisbatan yagona yechimga ega bo'ladi, ya'ni

$$x_i = \psi_i(x_{m+1}, x_{m+2}, \dots, x_n), i = \overline{1, m}, \quad (23.4)$$

bunda,  $\psi_1, \psi_2, \dots, \psi_m$  lar (23.2) sistemadan aniqlanadigan oshkormas funksiyalar. U holda,  $Q$  parallelepipedda (23.2) sistema,  $x_{m+1}, x_{m+2}, \dots, x_n$  o'zgaruvchilar erkli deb qaraladigan, (23.4) bog'lanishlarga teng kuchli bo'ladi.

Agar  $x_i = \psi_i(x_{m+1}, x_{m+2}, \dots, x_n)$ ,  $i = \overline{1, m}$ , funksiyalarni oshkor ravishda topish mumkin bo'lsa, ularni (1) ga keltirib qo'yib,  $n-m$  o'zgaruvchili,

$$z = f(\psi_1(x_{m+1}, \dots, x_n), \dots, \psi_m(x_{m+1}, \dots, x_n), x_{m+1}, \dots, x_n) = g(x_{m+1}, \dots, x_n) = g(M')$$

funksiyani hosil qilamiz.  $Q$  parallelepiped bilan chegaralangan sohada  $g(M')$  funksiyaning ixtiyoriy  $M'(x_{m+1}, \dots, x_n)$  nuqtadagi qiymati,  $f(M)$  funksiyaning (23.4) tenglamalarni qanoatlantiradigan, yoki (23.2) tenglamalarni qanoatlantiradigan, unga mos  $M(x_1, x_2, \dots, x_n)$  nuqtadagi qiymati bilan ustma-ust tushadi. Shu sababli, (23.1) funksiyaning  $Q$  parallelepipeddagi (23.2) bog'lanishlar bajarilgandagi shartli ekstremum masalasi,  $g(M')$  funksiyaning shartsiz ekstremumi masalasiga keltiriladi.

**23.4-misol.** O'zgaruvchilarning bir qismini yo'qotish usuli bo'yicha,

$$f(M) = x_1^2 + x_2^2 + x_3^2, \quad (M(x_1, x_2, x_3))$$

funksiyaning ekstremumini

$$x_1 + x_2 + x_3 = 1 \quad (*)$$

bog'lanishlar bajarilganda toping.

**Yechilishi.** Masaladagi  $\varphi(M) = x_1 + x_2 + x_3 - 1 = 0$  tenglamadan  $x_3 = 1 - x_1 - x_2$  ni topib,  $f(x)$  funksiyaga keltirib qo'yamiz va ikki o'zgaruvchili

$$g(M') = g(x_1, x_2) = 2x_1^2 + 2x_2^2 + 2x_1x_2 - 2x_1 - 2x_2 + 1 \quad (M' \in R^2)$$

funksiyani hosil qilamiz. Shunday qilib, berilgan  $f(M) = x_1^2 + x_2^2 + x_3^2$  funksiyaning (\*) tenglamaga nisbatan  $M_0(x_1^0, x_2^0, x_3^0) \in E$  nuqtadagi shartli ekstremumini topish masalasini,  $g(M')$  funksiyaning  $P(x_1^0, x_2^0)$  nuqtadagi shartsiz ekstremumini topish masalasiga keltirdik. Endi oxirgi masalaning stasionar nuqtalarini topamiz:

$$\begin{cases} \frac{\partial g}{\partial x_1} = 4x_1 + 2x_2 - 2 = 0 \\ \frac{\partial g}{\partial x_2} = 4x_2 + 2x_1 - 2 = 0 \end{cases} \Rightarrow \begin{cases} 2x_1 + x_2 - 1 = 0 \\ 2x_2 + x_1 - 1 = 0 \end{cases} \Rightarrow \begin{cases} x_1 = \frac{1}{3}, \\ x_2 = \frac{1}{3}. \end{cases}$$

Demak,  $M_0(x_1^0, x_2^0) = M_0\left(\frac{1}{3}, \frac{1}{3}\right)$  nuqta,  $g(M')$  ( $M' \in R^2$ ) funksiyaning

stasionar nuqtasidir. Bu stasionar nuqta,  $g(M')$  ( $M' \in R^2$ ) funksiyaning (absolyut) minimum nuqtasi bo'ladi, chunki  $g(x_1, x_2)$  qat'iy qavariq funksiyadir. Haqiqatan ham, bu funksiyaning ikkinchi tartibli xususiy hosilalari matrisasi  $\begin{pmatrix} 4 & 2 \\ 2 & 4 \end{pmatrix}$  bo'lib, uning bosh minorlari

$$\delta_1 = 4 > 0, \quad \delta_2 = 12 > 0 \Rightarrow \text{matrisa musbat aniqlangan.}$$

Endi  $x_1^0 = \frac{1}{3}, x_2^0 = \frac{1}{3}$  qiymatlarni  $x_3 = 1 - x_1 - x_2$  ifodaga keltirib qo'yib,  $x_3^0 = \frac{1}{3}$  ekanligini topamiz.

Demak,  $M_0(x_1^0, x_2^0, x_3^0) = M_0\left(\frac{1}{3}, \frac{1}{3}, \frac{1}{3}\right)$  nuqta - berilgan shartli ekstimum masalasida minimum nuqtasi bo'ladi. Maksimum nuqtasi mavjud emas, chunki,

$$\sup(x_1^2 + x_2^2 + x_3^2) = +\infty, \quad x_1 + x_2 + x_3 = 1, \quad x \in R^3.$$

Agar (23.4) funksiyalarni oshkor ko'rinishda topish qiyinchilik tug'dirsa yoki uning iloji bo'lmasa, quyidagicha ish ko'rish mumkin. Faraz qilaylik, (23.4) funksiyalar (23.1) ga keltirib qo'yilgan va uning

natijasida  $g(M')$  funksiya hosil qilingan, hamda ular (23.2) tenglamalarga keltirib qo'yilgan, natijada tenglamalar ayniyatlarga aylangan bo'lsin. U holda  $g(M')$  funksiyaning differensialini, birinchi differensial shaklining invariantligiga asosan,

$$dg = \sum_{i=1}^n \frac{\partial f}{\partial x_i} dx_i, \quad (23.5)$$

ko'rinishda yozish mumkin, bunda  $dx_{m+1}, dx_{m+2}, \dots, dx_n$  - erkli o'zgaruvchilarning differensiallari,  $dx_1, dx_2, \dots, dx_m$  lar esa, - (23.4) oshkormas funksiyalarning differensiallaridir. Yuqorida hosil qilingan ayniyatlarni differensiallab,

$$\left\{ \begin{array}{l} \frac{\partial \varphi_1}{\partial x_1} dx_1 + \frac{\partial \varphi_1}{\partial x_2} dx_2 + \dots + \frac{\partial \varphi_1}{\partial x_n} dx_n = 0, \\ \dots \\ \frac{\partial \varphi_m}{\partial x_1} dx_1 + \frac{\partial \varphi_m}{\partial x_2} dx_2 + \dots + \frac{\partial \varphi_m}{\partial x_n} dx_n = 0 \end{array} \right. \quad (23.6)$$

chiziqli tenglamalar sistemasini hosil qilamiz. Bu sistemadan (23.4) oshkormas funksiyalarning  $dx_1, dx_2, \dots, dx_m$  differensiallarini, erkli o'zgaruvchilarning  $dx_{m+1}, \dots, dx_n$  differensiallari orqali ifodalaymiz.  $dx_1, dx_2, \dots, dx_m$  lar uchun olingan ifodalarni (23.5) munosabatga keltirib qo'yib,

$$dg = \sum_{i=m+1}^n A_i(x_1, x_2, \dots, x_n) dx_i \quad (23.6^1)$$

tenglikni hosil qilamiz, bunda

$$x_j = \psi_j(x_{m+1}, x_{m+2}, \dots, x_n), \quad j = 1, 2, \dots, m.$$

Agar  $g(M')$  funksiya  $M'_0 = (x_{m+1}^0, x_{m+2}^0, \dots, x_n^0)$  nuqtada ekstremumga erishsa,  $dg|_{M'_0} = 0$ , ya'ni

$$\sum_{i=m+1}^n A_i(x_1^0, x_2^0, \dots, x_m^0, x_{m+1}^0, \dots, x_n^0) dx_i = 0 \quad (23.7)$$

bo'ladi, bunda

$$x_j^0 = \psi_j(x_{m+1}^0, x_{m+2}^0, \dots, x_n^0) = \psi_j(M'_0), \quad j = \overline{1, m}.$$

$dx_{m+1}, dx_{m+2}, \dots, dx_n$  lar erkli o'zgaruvchilarning differensiallari bo'lganligidan, (23.7) munosabatdan,

$$A_i(x_1^0, x_2^0, \dots, x_m^0, x_{m+1}^0, \dots, x_n^0) = 0, \quad i = \overline{m+1, n} \quad (23.8)$$

ekanligini olamiz.

Shunday qilib, (23.8) tengliklar sistemasi,  $g(M')$  funksiyaning  $M'_0$  nuqtada ekstremumga ega bo'lishining zaruriy shartlarini yoki  $f(M')$  funksiyaning, (23.2) bog'lanishlar qatnashganda,  $M'_0(x_1^0, x_2^0, \dots, x_n^0)$  nuqtada

shartli ekstremumga ega bo'lishning zaruriy shartlarini ifoda qiladi.

Bu erdan, qaralayotgan masalada ekstremumga shubhali bo'lgan  $M_0(x_1^0, x_2^0, \dots, x_n^0)$  nuqtalarni topish uchun,  $n$  ta  $x_1, x_2, \dots, x_n$  noma'lumlarga nisbatan,  $n$  ta,

$$\begin{cases} \varphi_i(x_1, x_2, \dots, x_n) = 0, i = \overline{1, m} \\ A_i(x_1, x_2, \dots, x_n) = 0, i = \overline{1, m+1, n} \end{cases} \quad (23.9)$$

tenglamalar sistemasini Yechish lozim bo'ladi.

Agar ekstremumga shubhali bo'lgan  $M_0(x_1^0, x_2^0, \dots, x_n^0)$  nuqta topilgan bo'lsa, uni ekstremumga tekshirish,  $d^2 f|_{M_0}$  ikkinchi tartibli to'liq differensialni hisoblashga bog'liq bo'ladi. Buni hisoblashda,  $f$  va  $\varphi_i$  ( $i = \overline{1, m}$ ) funksiyalar ikki marta differensiallanuvchi deb faraz qilib,  $dg$  uchun olingan (23.) tenglikni differensiallash va (23.4) oshkormas funksiyalarining  $dx_1, dx_2, \dots, dx_n$  differensiallari uchun (23.6) sistemadan topilgan ifodalardan foydalanish zarur. Natijada, biz,  $dx_{m+1}, dx_{m+2}, \dots, dx_n$  o'zgaruvchilarga nisbatan  $d^2 f|_{M_0}$  - kvadratik formani hosil qilamiz.

Agar bu kvadratik forma musbat (manfiy) aniqlangan bo'lsa, (23.1) funksiya  $M_0$  nuqtada shartli minimum (maksimum) ga erishadi.

**23.5-misol.** O'zgaruvchilarning bir qismini yo'qotish usuli yordamida,

$$u = f(x_1, x_2, x_3) = x_1 + x_2 - x_3 \quad (23.10)$$

funksiyaning ekstremumini,

$$\begin{cases} 4x_1^3 + 4x_2^3 + 4x_3^3 + 12x_1 + 12x_2 + 12x_3 = 13 \\ x_1 + x_2 = 1 \end{cases} \quad (23.11)$$

bog'lanishlar tenglamalari bajarilganda toping.

**Yechilishi.** Bu masalani yechishda yuqorida keltirilgan ikkinchi usuldan, ya'ni (23.11) tenglamalarda o'zgaruvchilardan qandaydir ikkitasini uchinchisi orqali oshkor ravishda ifodalash mumkin bo'limgan usuldan foydalanamiz.

(23.11) sistema ikki marta differensiallanuvchi  $x_1(x_1)$  va  $x_2(x_1)$  oshkormas funksiyalarni aniqlaydi, deb faraz qilamiz va ular bog'lanishlar tenglamalariga keltirib qo'yilgan deb hisoblab, (23.11) tenglamalarni ayniyatlardan sistemasi kabi qaraymiz. (23.11) ayniyatlarni har ikkala tomonidagi differensiallarni hisoblab, natijada

$$\begin{cases} (x_1^2 + 1)dx_1 + (x_2^2 + 1)dx_2 + (x_3^2 + 1)dx_3 = 0 \\ dx_1 + dx_2 = 0 \end{cases}$$

munosablarni hosil qilamiz. Bu erdan,

$$\begin{cases} dx_3 = -dx_1, \\ dx_3 = \frac{-2x_1 + 1}{x_3^2 + 1} dx_1 \end{cases} \quad (23.12)$$

ekanligini topamiz. Bu ifodalarni, (23.10) funksiyaning  $du = dx_1 + dx_2 - dx_3$ , ko'rinishdagi differensiali ifodasiga keltirib qo'yib,

$$du = \frac{2x_1 - 1}{x_3^2 + 1} dx_1 = Adx_1 \quad (23.13)$$

munosabatni hosil qilamiz.

Endi, (23.11) tenglamalar va  $A = 0$  tenglamalardan tashkil topgan,

$$\begin{cases} 4x_1^3 + 4x_2^3 + 4x_3^3 + 12x_1 + 12x_2 + 12x_3 - 13 = 0, \\ x_1 + x_2 - 1 = 0, \\ \frac{2x_1 - 1}{x_3^2 + 1} = 0 \end{cases}$$

tenglamalar sistemasini (bu sistema, qaralayotgan hol uchun (23.9) sistemadan iborat) qaraymiz. Bu sistema, yagona  $x_1 = \frac{1}{2}$ ,  $x_2 = \frac{1}{2}$ ,  $x_3 = 0$  yechimga ega, ya'ni  $M_0 = \left(1/2, \frac{1}{2}, 0\right)$  - (23.10) funksiyaning (23.11) bog'lanishlarga nisbatan ekstremumga shubhali bo'lgan yagona nuqtasidir.

Endi  $du$  ning (23.13) dagi ifodasini differensiallaysiz:

$$d^2u = \frac{2(x_3^2 + 1)dx_1 - (2x_1 - 1)2x_3 dx_3}{(x_3^2 + 1)^2} dx_1.$$

Oxirgi ifodadan, (23.12) tenglamalarni hisobga olib,

$$d^2u|_{M_0} = 2(dx_1)^2$$

munosabatga kelamiz. Modomiki,  $2(dx_1)^2 - dx_1$  bir o'zgaruvchining musbat aniqlangan kvadratik formasi ekan, (23.10) funksiya, (23.11) bog'lanishlarda  $M_0$  nuqtada minimumga erishadi.

**23.3-eslatma.** Biz masalani, (23.11) sistema ikki marta differensiallanuvchi  $x_1(x_i)$  va  $x_3(x_i)$  funksiyalarini aniqlaydi, deb faraz qilib, echdik. Endi, bu shartning  $M_0 = (1/2, 1/2, 0)$  nuqtaning biror atrofida bajarilishini ko'rsatamiz. Buning uchun, 1- banddag'i 1)- 3) shartlarni tekshiramiz.

$\varphi_1(x_1, x_2, x_3) = 4x_1^3 + 4x_2^3 + 4x_3^3 + 12x_1 + 12x_2 + 12x_3 - 13$  va  $\varphi_2(x_1, x_2, x_3) = x_1 + x_2 - 1$  funksiyalar  $M_0$  nuqtaning ixtiyoriy atrofida differensiallanuvchi;  $\frac{\partial \varphi_1}{\partial x_1} = 12(x_1^2 + 1)$ ,  $\frac{\partial \varphi_1}{\partial x_3} = 12(x_3^2 + 1)$ ,  $\frac{\partial \varphi_2}{\partial x_2} = 1$ ,  $\frac{\partial \varphi_2}{\partial x_3} = 0$  xususiy hosilalar  $M_0$  nuqtada

uzluksiz;  $\varphi_1(x_1, x_2, x_3)$  va  $\varphi_2(x_1, x_2, x_3)$  funksiyalar  $M_0$  nuqtada nolga aylanadi va

$$\left. \frac{D(\varphi_1, \varphi_2)}{D(x_2, x_3)} \right|_{M_0} = -12 \neq 0.$$

Demak, 1)- 3) shartlarga asosan, (23.11) sistema  $M_0$  nuqtaning biror atrofida yagona  $x_2(x_i)$  va  $x_3(x_i)$  funksiyalarni aniqlaydi. Bundan tashqari,  $\varphi_1(x_1, x_2, x_3)$  va  $\varphi_2(x_1, x_2, x_3)$  funksiyalar  $M_0$  nuqtaning ixtiyoriy atrofida ikki marta differensiallanuvchi, u holda  $x_2(x_i)$  va  $x_3(x_i)$  funksiyalar ham ikki marta differensiallanuvchi bo'ladi.

**23.4.2. Ko'p o'zgaruvchili funksianing shartli ekstremumini topishning Lagranj ko'paytuvchilari qoidasi.** Shartli ekstremum masalasini yechishda yuqorida ko'rib o'tilgan usullarni ko'p hollarda qo'llab bo'lmaydi, ya'ni bog'lanishlardan o'zgaruvchilarning bir qismini qolganlari orqali oshkor yoki oshkormas shaklda ifodalash mumkin bo'lmaydi.

Bunday masalalarni yechishda quyidagicha ish ko'rildi.

Bizga, (23.1) funksianing ekstremumini, (23.2) bog'lanishlar bajarilganda, topish masalasi qo'yilgan bo'lsin, hamda  $f(M)$ ,  $\varphi_i(M), (i=1, m)$  funksiyalar  $M_0(x_1^0, x_2^0, \dots, x_n^0)$  nuqtada va uning biror atrofida uzluksiz differensiallanuvchi, va nihoyat,

$$\begin{pmatrix} \frac{\partial \varphi_1(M_0)}{\partial x_1} & \frac{\partial \varphi_1(M_0)}{\partial x_2} & \dots & \frac{\partial \varphi_1(M_0)}{\partial x_n} \\ \frac{\partial \varphi_2(M_0)}{\partial x_1} & \frac{\partial \varphi_2(M_0)}{\partial x_2} & \dots & \frac{\partial \varphi_2(M_0)}{\partial x_n} \\ \vdots & \vdots & \ddots & \vdots \\ \frac{\partial \varphi_m(M_0)}{\partial x_1} & \frac{\partial \varphi_m(M_0)}{\partial x_2} & \dots & \frac{\partial \varphi_m(M_0)}{\partial x_n} \end{pmatrix}$$

matrisaning rangi  $m$  ga teng bo'lsin. Quyidagi  $n+m$  o'zgaruvchili

$$L(M, \lambda) = f(M) + \lambda_1 \varphi_1(M) + \lambda_2 \varphi_2(M) + \dots + \lambda_m \varphi_m(M) \quad (23.14)$$

funksiyani kiritamiz, bunda  $M \in G$  ( $G \subset R^n$ ),  $\lambda \in R^m$ ,  $\lambda = (\lambda_1, \lambda_2, \dots, \lambda_m)$ .

$\lambda_1, \lambda_2, \dots, \lambda_m$  - Lagranj ko'paytuvchilari,  $\lambda$  - Lagranj vektori,  $L(M, \lambda)$  funksiya esa, Lagranj funksiyasi deb ataladi.

**23.4-teorema (Lagranj ko'paytuvchilari qoidasi).** Faraz qilaylik,  $M_0(x_1^0, x_2^0, \dots, x_n^0)$  -  $f(M)$  funksianing (23.2) bog'lanishlar bajarilgandagi shartli ekstremum nuqtasi bo'lsin. U holda, shunday yagona  $\lambda^0 = (\lambda_1^0, \lambda_2^0, \dots, \lambda_m^0)$  Lagranj vektori topiladiki,  $(M_0, \lambda^0)$  juftlik uchun,

$$\left\{ \begin{array}{l} \frac{\partial L(M_0, \lambda^0)}{\partial M} = 0 \Leftrightarrow \frac{\partial L(M_0, \lambda^0)}{\partial x_j} = 0, j = \overline{1, m}, \\ \frac{\partial L(M_0, \lambda^0)}{\partial \lambda_i} = \varphi_i(M_0) = 0, \dots, \frac{\partial L(M_0, \lambda^0)}{\partial \lambda_m} = \varphi_m(M_0) = 0 \end{array} \right. \quad (23.15)$$

$$\left\{ \begin{array}{l} \frac{\partial L(M_0, \lambda^0)}{\partial M} = 0, \dots, \frac{\partial L(M_0, \lambda^0)}{\partial x_n} = 0, \\ \frac{\partial L(M_0, \lambda^0)}{\partial \lambda_1} = \varphi_1(M_0) = 0, \dots, \frac{\partial L(M_0, \lambda^0)}{\partial \lambda_m} = \varphi_m(M_0) = 0 \end{array} \right. \quad (23.16)$$

munosabatlardan bajariladi.

(23.15), (23.16) munosabatlarni qanoatlantiruvchi  $(M_0, \lambda^0)$  juftlik-Lagranj funksiyasining stasionar nuqtasi, shartli ekstremum masalasining *shartli stasionar nuqtasi* deyiladi.

23.4-teoremedan kelib chiqadiki, (23.1) funksiyaga, (23.2) bog'lanishlar qatnashganda, shartli ekstremum berishi mumkin bo'lgan nuqtalarni topish uchun,  $n+m$  ta,  $x_1, x_2, \dots, x_n, \lambda_1, \lambda_2, \dots, \lambda_m$ , noma'lumlarga nisbatan,

$$\left\{ \begin{array}{l} \varphi_i(x_1, x_2, \dots, x_n) = 0, i = \overline{1, n} \\ \frac{\partial L(x_1, \dots, x_n, \lambda_1, \dots, \lambda_m)}{\partial x_j} = 0, j = \overline{1, n} \end{array} \right. \quad (23.17)$$

$n+m$  ta tenglamalar sistemasi yechish lozim bo'ladi. (23.17) tenglamalar sistemasi- *stasionarlik* tenglamalari sistemasi deyiladi.

Shunday qilib, agar  $(M_0, \lambda^0)$  juftlik (23.17) tenglamalar sistemasing yechimi bo'lsa (bunday yechimlar bir nechta bo'lishi ham mumkin),  $M_0(x_1^0, x_2^0, \dots, x_n^0)$  nuqta - (23.1) funksiyaga, (23.2) bog'lanishlar qatnashganda, shartli ekstremum berishi mumkin bo'lgan nuqta bo'ladi.

Bu nuqtaning shartli ekstremum nuqtasi bo'lishini aniqlashda, (23.1) funksiya va (23.2) bog'lanishlarda qatnashayotgan funksiyalar ikkinchi tartibli uzluksiz xususiy hosilalarga ega, deb faraz qilinib, Lagranj funksiyasining, belgilangan  $\lambda_1^0, \lambda_2^0, \dots, \lambda_m^0$  lar uchun,  $M_0(x_1^0, x_2^0, \dots, x_n^0)$  nuqtada  $x_1, x_2, \dots, x_n$  o'zgaruvchilar bo'yicha hisoblangan,

$$d^2 L(M_0, \lambda^0) = \sum_{k=1}^n \sum_{j=1}^m \frac{\partial^2 L(M_0, \lambda^0)}{\partial x_k \partial x_j} dx_k dx_j \quad (23.18)$$

ikkinchi tartibli differensiali qaraladi.

**23.5-teorema (shartli ekstremumning ikkinchi tartibli zaruriy sharti).** Faraz qilaylik,  $M_0(x_1^0, x_2^0, \dots, x_n^0) - f(M)$  funksiyaning (23.2) bog'lanishlar bajarilgandagi shartli minimum (maksimum) nuqtasi,  $f(M)$ ,  $\varphi_i(M), (i = \overline{1, m})$  funksiyalar  $M_0(x_1^0, x_2^0, \dots, x_n^0)$  nuqtaning biror atrofida ikkinchi tartibli uzluksiz xususiy hosilalarga ega, hamda  $M_0(x_1^0, x_2^0, \dots, x_n^0)$  nuqtada (23.3) matrisaning rangi  $m$  ga teng bo'lsin. U holda, shunday

$\lambda^0 = (\lambda_1^0, \lambda_2^0, \dots, \lambda_m^0)$  Lagranj vektori topiladiki,  $(M_0, \lambda^0)$  juftlik - Lagranj funksiyasining stasionar nuqtasi bo'ldi va

$$\left\{ \begin{array}{l} \frac{\partial \varphi_1(M_0)}{\partial x_1} dx_1 + \frac{\partial \varphi_1(M_0)}{\partial x_2} dx_2 + \dots + \frac{\partial \varphi_1(M_0)}{\partial x_n} dx_n = 0, \\ \frac{\partial \varphi_m(M_0)}{\partial x_1} dx_1 + \frac{\partial \varphi_m(M_0)}{\partial x_2} dx_2 + \dots + \frac{\partial \varphi_m(M_0)}{\partial x_n} dx_n = 0 \end{array} \right. \quad (23.19)$$

tenglamalar sistemasini qanoatlantiruvchi  $dx_1, dx_2, \dots, dx_n$  lar uchun  
 $d^2 L(M_0, \lambda^0) \geq 0 \quad (d^2 L(M_0, \lambda^0) \leq 0)$

munosabat bajariladi.

**23.6-teorema (shartli ekstremumning yetarli sharti).**  $f(M, \varphi_i(M), (i = \overline{1, m}))$ , funksiyalar  $M_0(x_1^0, x_2^0, \dots, x_n^0)$  nuqtaning biror atrofida ikkinchi tartibli uzlusiz xususiy hosilalarga ega,  $M_0(x_1^0, x_2^0, \dots, x_n^0)$  nuqtada (23.3) matrisaning rangi  $m$  ga teng, hamda  $(M_0, \lambda^0)$  juftlik - Lagranj funksiyasining stasionar nuqtasi bo'lsin. U holda:

1) agar  $d^2 L(M_0, \lambda^0)$ ,  $dx_1, dx_2, \dots, dx_n$  lar (23.19) tenglamalar sistemasini qanoatlantirganda, musbat aniqlangan kvadratik forma bo'lsa,  $M_0(x_1^0, x_2^0, \dots, x_n^0)$  nuqta -  $f(M)$  funksiyaning, (23.2) bog'lanishlar bajarilganda, shartli minimum nuqtasi bo'ldi.

2) agar  $d^2 L(M_0, \lambda^0)$ ,  $dx_1, dx_2, \dots, dx_n$  lar (23.19) tenglamalar sistemasini qanoatlantirganda, manfiy aniqlangan kvadratik forma bo'lsa,  $M_0(x_1^0, x_2^0, \dots, x_n^0)$  nuqta -  $f(M)$  funksiyaning, (23.2) bog'lanishlar bajarilganda, shartli maksimum nuqtasi bo'ldi.

3) agar  $d^2 L(M_0, \lambda^0)$ ,  $dx_1, dx_2, \dots, dx_n$  lar (23.19) tenglamalar sistemasini qanoatlantirganda, aniqlanmagan kvadratik forma (ham musbat, ham manfiy qiymatlar qabul qiluvchi) bo'lsa,  $M_0(x_1^0, x_2^0, \dots, x_n^0)$  nuqta -  $f(M)$  funksiyaning shartli ekstremum nuqtasi bo'lmaydi.

Xususiy holda,  $u = f(x, y)$  funksiya  $\varphi(x, y) = 0$  bog'lanishlar tenglamasi bilan berilgan bo'lsa, Lagranj funksiyasi quyidagi ko'rinishda bo'ldi:

$$L(x, y, \lambda) = f(x, y) + \lambda \varphi(x, y).$$

(23.17) tenglamalar sistemasi, uchta tenglamadan iborat bo'ldi:

$$\left\{ \begin{array}{l} \frac{\partial L}{\partial x} = 0, \\ \frac{\partial L}{\partial y} = 0, \\ \varphi(x, y) = 0, \end{array} \right.$$

$(M_0, \lambda^*)$  juftlik- Lagranj funksiyasining stasionar nuqtasi bo'lsin va

$$\Delta = \begin{vmatrix} 0 & \varphi_x'(M_0) & \varphi_y'(M_0) \\ \varphi_x'(M_0) & L_{xx}'(M_0, \lambda_0) & L_{xy}'(M_0, \lambda_0) \\ \varphi_y'(M_0) & L_{xy}'(M_0, \lambda_0) & L_{yy}'(M_0, \lambda_0) \end{vmatrix}.$$

Agar  $\Delta < 0$  bo'lsa,  $M_0(x^0, y^0)$  nuqta -  $u = f(x, y)$  funksiyaning,  $\varphi(x, y) = 0$  bog'lanishlar bajarilganda, shartli maksimum nuqtasi bo'ladi.

Agar  $\Delta > 0$  bo'lsa,  $M_0(x^0, y^0)$  nuqta -  $u = f(x, y)$  funksiyaning,  $\varphi(x, y) = 0$  bog'lanishlar bajarilganda, shartli minimum, nuqtasi bo'ladi.

Izohlar.

1. Funksiyalarning ekstremumini bog'lanishlar qatnashganda topish masalalari juda keng tarqalgan, ular ekstremal masalalarning bir qismidan iborat bo'lib, ularni o'rghanuvchi bo'lim - *ekstremal masalalar nazariyasi*, hozirgi vaqtida, ko'p amaliy masalalarda qo'llanilmoqda.

2. Biz yuqorida ko'rgan masalalarda, ham ekstremumini topish talab qilingan funksiyani, ham bog'lanishlar funksiyalarini etarli silliq, deb faraz qilgan edik. Lekin bog'lanishlar faqat tengliklar ko'rinishida emas, balki tengsizliklar ko'rinishida ham bo'lishi, ulardagi funksiyalar odadagi ma'noda differensiallanuvchi bo'lmashligi ham mumkin.

3. Bog'lanishlar funksiyalari yordamida tuzilgan (23.3) matrisaning rangi  $m$  ga teng bo'lsin, degan talab ham ancha kuchli, ko'p masalalarda bunday talabni qo'yish mumkin emas. Bu holda, Lagranj ko'paytuvchilari usulining umumlashmasidan, aniqrog'i, umumlashgan Lagranj funksiyasidan foydalaniladi.

**23.6-misol.** Lagranj usulidan foydalanib, ushbu  $u = 2x + 4y - 5$  funksiyaning  $x^2 + y^2 = 125$  bog'lanishlarni qanoatlantiruvchi shartli ekstremumlarini toping.

**Yechilishi.** Dastlab Lagranj funksiyasini quramiz:

$$L(x, y, \lambda) = 2x + 4y - 5 + \lambda(x^2 + y^2 - 125).$$

Endi Lagranj funksiyasidan xususiy hosilalarni olib, (23.17) tenglamalar sistemasini tuzamiz:

$$\begin{aligned} \frac{\partial L}{\partial x} &= 2 + 2\lambda x, \\ \frac{\partial L}{\partial y} &= 4 + 2\lambda y, \Rightarrow \begin{cases} 2 + 2\lambda x = 0, \\ 4 + 2\lambda y = 0, \\ x^2 + y^2 = 125, \end{cases} \\ x^2 + y^2 &= 125, \end{aligned}$$

Bu sistema ikkita Yechimiga ega:

$$x_1 = -5, y_1 = -10, \lambda_1 = 0,2; \quad x_1 = 5, y_1 = 10, \lambda_1 = -0,2.$$

$L(x, y, \lambda)$  Lagranj funksiyasining ikkinchi tartibli xususiy hosilalarini topib, ikkinchi tartibli differensialini tuzamiz:

$$\frac{\partial^2 L}{\partial x^2} = 2\lambda, \quad \frac{\partial^2 L}{\partial x \partial y} = 0, \quad \frac{\partial^2 L}{\partial y^2} = 2\lambda, \quad d^2 L = 2\lambda(dx^2 + dy^2).$$

$\lambda_1 = 0,2$  bo‘lganda  $d^2 L > 0$ . Shuning uchun, 23.6-teoremaga asosan,  $M_1(-5; -10)$  nuqtada  $u$  funksiya shartli minimumga ega va  $u_{\min} = u(-5, -10) = -55$ .

$\lambda_2 = -0,2$  bo‘lganda  $d^2 L < 0$ . Shuning uchun, 23.6-teoremaga asosan,  $M_2(5; 10)$  nuqtada  $u$  funksiya shartli maksimumga ega va uning maksimum qiymati 45 ga teng,  $u_{\max} = u(5, 10) = 45$ .

$u$  funksiyani shartli ekstremumga tekshirishning boshqa yo‘lini qaraymiz.

$\lambda_1 = 0,2$  bo‘lganda  $\varphi(x, y) = x^2 + y^2 - 125$ ,  $\varphi_x = 2x$ ,  $\varphi_y = 2y$ ,  $\varphi_z(-5, -10) = -10$ ,

$$\varphi_z(-5, -10) = -20, \quad \frac{\partial^2 L}{\partial x^2} = 0,4, \quad \frac{\partial^2 L}{\partial x \partial y} = 0, \quad \frac{\partial^2 L}{\partial y^2} = 0,4.$$

Demak,

$$\Delta = \begin{vmatrix} 0 & -10 & -20 \\ -10 & 0,4 & 0 \\ -20 & 0 & 0,4 \end{vmatrix} = 200 > 0$$

Demak,  $M_1(-5; -10)$  nuqtada  $u$  funksiya shartli minimumga ega va uning maksimum viymati  $-55$  ga teng, ya’ni  $u_{\min} = u(-5, -10) = -55$ .

Xuddi shunga o‘xshash,  $\lambda_2 = -0,2$  bo‘lgan holda va  $M_2(5; 10)$  nuqtada

$$\Delta = \begin{vmatrix} 0 & 10 & 20 \\ 10 & -0,4 & 0 \\ 20 & 0 & -0,4 \end{vmatrix} = -200 < 0.$$

Demak,  $M_2(5; 10)$  nuqtada  $u$  funksiya shartli maksimumga ega va uning qiymati 45 ga teng, ya’ni  $u_{\max} = u(5, 10) = 45$ .

*Misolni Maple tizimidan foydalananib yechish:*

> readlib(extrema);

> extrema(2\*x+4\*y-5,{x^2+y^2-125=0},{x,y},'u');u;

$$\{-55, 45\}$$

$$\{\{y = 10, x = 5\}, \{y = -10, x = -5\}\}$$

**23.7-misol.** Lagranj usulidan foydalananib,  $u = xy + yz$  funksiyaning  $x^2 + y^2 = 2$ ,  $y + z = 2$  ( $x > 0$ ,  $y > 0$ ,  $z > 0$ ) bog‘lanishlarni qanoatlantiruvchi ekstremumlarini toping.

**Yechilishi.** Dastlab Lagranj funksiyasini tuzamiz:

$$L(x, y, z, \lambda, \mu) = xy + yz + \lambda(x^2 + y^2 - 2) + \mu(y + z - 2).$$

Bu Lagranj funksiyasidan xususiy hosilalarni olib,

$$\begin{cases} \frac{\partial L}{\partial x} = y + 2\lambda x, \\ \frac{\partial L}{\partial y} = x + z + 2\lambda y + \mu, \\ \frac{\partial L}{\partial z} = y + \mu, \\ x^2 + y^2 = 2, \\ y + z = 2. \end{cases} \Rightarrow \begin{cases} y + 2\lambda x = 0, \\ x + z + 2\lambda y + \mu = 0, \\ y + \mu = 0, \\ x^2 + y^2 = 2, \\ y + z = 2. \end{cases}$$

tenglamalar sistemasini tuzamiz. Bu sistemadan  $\lambda$  va  $\mu$  sonlarni va stasionar nuqtaning koordinatalarini topamiz:  $x = y = z = 1$ ,  $\lambda = -\frac{1}{2}$ ,  $\mu = -1$ .  $L(x, y, z, \lambda, \mu)$  Lagranj funksiyasining ikkiinchi tartibli differensialini topamiz va unga  $\lambda = -\frac{1}{2}$  qiymatni keltirib qo'yamiz:

$$d^2L = 2\lambda(dx^2 + dy^2) + 2dxdy + 2dydz = -dx^2 - dy^2 + 2dxdy + 2dydz.$$

Bog'lanishlar tenglamasidan,  $dy = -dx = -dz$  ekanligi kelib chiqadi. Buni e'tiborga olsak, u holda,  $d^2L = -dx^2 - 3dy^2 - 2dz^2 < 0$  bo'ladi.

Demak, 23.6-teoremaga asosan,  $M_0(1, 1, 1)$  nuqtada  $u$  funksiya shartli maksimumga ega va uning qiymati 2 ga teng, ya'ni  $u_{\max} = u(1, 1, 1) = 2$ .

**23.5. Ko'p o'zgaruvchili funksiyaning eng kichik va eng katta qiymatlari.** Agar  $u = f(M)$  funksiya chegaralangan yopiq  $\{M\} (\{M\} \subset R^n)$  to'plamda uzliksiz bo'lsa, u holda bu funksiya shu to'plamda o'zining aniq yuqori va aniq quyi chegaralariga erishadi (**Veyershtrass teoremasi**).

$u = f(M)$  funksiya chegaralangan sohada differensiallanuvchi va sohaning chegarasida uzliksiz bo'lsa, bu funksiya, yoki stasionar nuqtalarda, yoki sohaning chegara nuqtalarida o'zining eng katta va eng kichik qiymatlariga erishadi.

Ko'p o'zgaruvchili funksiyaning eng kichik va eng katta qiymatlarini topish qoidasi quyidagicha :

1) berilgan sohada joylashgan stasionar nuqtalarni topish va funksiyaning bu nuqtalardagi qiymatlarini hisoblash;

2) sohaning chegarasini tashkil qiluvchi chiziqda funksiyaning eng kichik va eng katta qiymatlarini topish;

3) funksiyaning topilgan barcha qiymatlarini solishtirish: bularning eng kichigi va eng kattasi, mos ravishda, funksiyaning qaralayotgan sohada eng kichik va eng katta qiymati bo‘ladi.

**23.8-misol.** Ushbu  $u = x^2 - 4x - y^2$  funksiyaning  $x^2 + y^2 \leq 16$  doiradagi eng kichik va eng katta qiymatlarini toping.

**Yechilishi.** 1.  $u = x^2 - 4x - y^2$  funksiyaning birinchi tartibli xususiy hosilalarini topamiz:

$$u'_x = 2x - 4, \quad u'_y = -2y.$$

Bu xususiy hosilalarni nulga tenglashtirib, sistemani Yechib, bitta  $P_0(2;0)$  stasionar nuqtani topamiz, unda funksiyaning qiymati  $-4$  ga teng, ya’ni  $z(2;0) = 4 - 8 - 0 = -4$

2. Endi funksiyaning chegaradagi, ya’ni  $x^2 + y^2 = 16$  aylanadagi eng kichik va eng katta qiymatlarini topamiz.  $u = x^2 - 4x - y^2$  funksiyani bu aylana nuqtalarida bitta  $x$  o‘zgaruvchining funksiyasi sifatida ifodalash mumkin.  $y^2 = 16 - x^2$  funksiyani  $u$  funksiyaga keltirib qo‘yamiz:  $u = x^2 - 4x + y^2 = 2x^2 - 4x - 16$ .  $y = \pm\sqrt{16 - x^2}$  funksiyaning aniqlanish sohasi  $[-4; 4]$  bo‘ladi.

Shunday qilib, ikki o‘zgaruvchili funksiyaning  $x^2 + y^2 = 16$  aylanadagi eng kichik va eng katta qiymatlarini topish, bir o‘zgaruvchili,  $u = 2x^2 - 4x - 16$  funksiyaning  $[-4; 4]$  kesmadagi eng kichik va eng katta qiymatlarini topishga keltirildi. Bu funksiyaning  $(-4; 4)$  oraliqdagi kritik nuqtalarini topamiz va oraliqning chetlaridagi qiymatlarini topamiz:  $u' = 4x - 4$ ,  $4x = 4$ , bundan  $x = 1$  kritik nuqtani olamiz:  $u|_{x=1} = -18$ , so‘ngra  $u|_{x=4} = 0$ ,  $u|_{x=-4} = 32$  ekanligini topamiz.

3. Berilgan funksiyaning stasionar va chegara nuqtalardagi qiymatlarini hisoblab, ularni solishtiramiz:

$$u(-2;0) = -4, \quad u(1;-2\sqrt{2}) = -11, \quad u(4;0) = 0, \quad u(1;2\sqrt{2}) = 11, \quad u(-4;0) = 32 \\ u(0;4) = -16, \quad u(0;-4) = -16.$$

Demak, berilgan funksiyaning eng kichik qiymati  $-16$ , eng katta qiymati esa,  $32$  bo‘ladi,

$$u_{e,kich} = u(0;4) = u(0;-4) = -16, \quad u_{e,kat} = u(-4;0) = 32.$$

**23.9-misol.** To‘g‘ri burchakli parallelepipeddan iborat usti ochiq bak  $V$  litr hajmga ega. Bakning o‘lchovlari qanday bo‘lganda, unga sarflanadigan material eng kam bo‘ladi?

**Yechilishi.** To‘g‘ri burchakli parallelepipedning o‘lchovlarini  $x, y, z$  ( $x > 0, y > 0, z > 0$ ) deb belgilaymiz. U holda, uning hajmi,  $V = xyz$

bo'ladi. Bundan  $z = \frac{V}{xy}$ . Masalaning shartiga ko'ra, to'g'ri burchakli parallelepipedning to'la sirti,

$$S = S(x, y) = 2(xz + 2yz) + xy = 2(x + y)\frac{V}{xy} + xy = 2V\left(\frac{1}{x} + \frac{1}{y}\right) + xy$$

bo'ladi.  $S(x, y)$  funksiyaning eng kichik qiymatini topamiz. Ravshanki,

$$S'_x = -\frac{2V}{x^2} + y,$$

$$S'_y = -\frac{2V}{y^2} + x$$

Stasionar nuqtalarni topish uchun, xususiy hosilalarni nulga tenglashtirib, hosil qilingan sistemani echamiz:

$$\begin{cases} -\frac{2V}{x^2} + y = 0 \\ -\frac{2V}{y^2} + x = 0 \end{cases} \Rightarrow \begin{cases} x_0 = \sqrt[3]{2V}, \\ y_0 = \sqrt[3]{2V}, \end{cases} P_0(x_0, y_0) = (\sqrt[3]{2V}, \sqrt[3]{2V}).$$

Ikki o'zgaruvchili funksiya minimumining yetarli shartini tekshiramiz:

$$S''_{xx} = \frac{4V}{x^3}, \quad S''_{xx}(\sqrt[3]{2V}, \sqrt[3]{2V}) = 2$$

$$S''_{yy} = \frac{4V}{y^3}, \quad S''_{yy}(\sqrt[3]{2V}, \sqrt[3]{2V}) = 2$$

$$S''_{xy} = 1, \quad S''_{xy}(\sqrt[3]{2V}, \sqrt[3]{2V}) = 1$$

$$\Delta = S''_{x^2}(P_0)S''_{y^2}(P_0) - S''_{xy}(P_0)^2 = 4 - 1 = 3 > 0, \quad S''_{xx}(P_0) > 0.$$

Demak,  $S(x, y)$  funksiya,  $P_0(\sqrt[3]{2V}, \sqrt[3]{2V})$  nuqtada minimumga ega bo'ladi:

$$z(P_0) = \frac{V}{x_0 y_0} = \frac{V}{\sqrt[3]{4V^2}} = \frac{\sqrt[3]{2V}}{2}; \quad S_{\min} = S(P_0) = 2V\left(\frac{1}{\sqrt[3]{2V}} + \frac{1}{\sqrt[3]{2V}}\right) + \sqrt[3]{4V^2} = 3\sqrt[3]{4V^2}.$$

### Mustaqil yechish uchun misollar

Quyidagi ikki o'zgaruvchili funksiyalarni ekstremumga tekshiring:

**23.1.**  $u = -x^2 - xy$ .

**23.2.**  $u = 2x^2 + xy + y^2$ .

**23.3.**  $u = x^3 - 3xy - 3y$ .

**23.4.**  $u = x^4 + y^4 - 4xy$ .

**23.5.**  $u = -2x^2 + xy - 2y^2 + 6x + 6y$ .

**23.6.**  $u = x^3 - 9xy + y^3$ .

**23.7.**  $u = x^3 + 6xy + 8y^3 - 1$ .

**23.8.**  $u = xy(1 - x - y)$ .

**23.9.**  $u = x^2 - 3xy + y^2 - 4x + 5y + 6$ .

**23.10.**  $u = x^2 + y^2 - 8x - 2$ .

**23.11.**  $u = x^2 + xy - y^2 - 3x - 6y$ .

**23.12.**  $u = 3x^2 - x^3 + 3y^2 + 4y$ .

**23.13.**  $u = 3x^2 - y^2 + 4y + 5$ .

**23.14.**  $u = x^2 + xy + 2y^2 - x + y$ .

$$23.15. u = -x^2 - xy - y^2 + 3x + 6y.$$

$$23.23. u = x^3 - 3axy + y^3.$$

$$23.19. u = \sin x + \sin y + \sin(x+y), \text{ bunda } 0 \leq x \leq \frac{\pi}{2}, \quad 0 \leq y \leq \frac{\pi}{2}.$$

$$23.20. u = xe^{y+x\sin y}.$$

$$23.16. u = (x+y^2)e^{x^2/2}.$$

$$23.18. u = x^2 + xy + y^2 - 4 \ln x - 10 \ln y.$$

$$23.22. f(x,y) = x^2 - xy + y^2 + 2x + 2y - 4.$$

$$23.23. f(x,y) = 2x^3 + 3xy + 2y^3.$$

$$23.24. f(x,y) = x^3 + y^3 + 3x^2 - 3y^2.$$

Quyidagi uch o'zgaruvchili funksiyalarni ekstremumga tekshiring:

$$23.25. u = x^2 + y^2 + z^2 - 4x + 6y - 2z.$$

$$23.26. u = x^2 + y^2 + z^2 - xy + x - 2z.$$

$$23.27. u = x^2 + y^2 + (z+1)^2 - xy + x.$$

$$23.28. u = x^3 + y^2 + z^2 + 6xy - 4z.$$

$$23.29. u = xyz(16 - x - y - 2z).$$

$$23.30. u = \frac{226}{x} + \frac{x^2}{y} + \frac{y^2}{z} + z^2.$$

$$23.31. u = \frac{1}{z} + \frac{z}{y} + \frac{y}{x} + x + 1.$$

$$23.32. u = x^{2/3} + y^{2/3} + z^{2/3}.$$

Quyidagi ikki o'zgaruvchili funksiyalarni shartli ekstremumga tekshiring:

$$23.33. u = xy, \quad x + y - 2 = 0.$$

$$23.34. u = x^2 + y^2, \quad x + y - 1 = 0.$$

$$23.35. u = x^2 + y^2, \quad 3x + 4y - 12 = 0.$$

$$23.36. u = xy, \quad 2x + 3y - 5 = 0.$$

$$23.37. u = xy^2, \quad x + 2y - 1 = 0.$$

$$23.38. u = x^2 + y^2 - xy + x + y - 4, \quad x + y + 3 = 0.$$

$$23.39. u = \cos^2 x + \cos^2 y, \quad x - y - \frac{\pi}{4} = 0.$$

$$23.40. u = 5 - 3x - 4y, \quad x^2 + y^2 = 25.$$

$$23.41. u = 1 - 4x - 8y, \quad x^2 - 8y^2 = 8.$$

$$23.42. u = x^2 + xy + y^2, \quad x^2 + y^2 = 1.$$

Quyidagi uch o'zgaruvchili funksiyalarni shartli ekstremumga tekshiring.

$$23.43. u = 2x^2 + 3y^2 + 4z^2, \quad x + y + z - 13 = 0.$$

$$23.44. u = xyz^2, \quad x + y + z - 12 = 0, \quad x > 0, y > 0, z > 0.$$

$$23.45. u = x - 2y + 2z, \quad x^2 + y^2 + z^2 - 9 = 0.$$

$$23.46. u = xy + 2xz + 2yz, \quad xyz = 108.$$

$$23.47. u = x^2 + y^2 + z^2, \quad \frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1, \quad a > 0, b > 0, c > 0.$$

23.48.  $f(x,y) = x^3 + y^2$  funksiyaning  $x^2 + y^2 = 1$  aylanadagi ekstremum qiyamatlarini toping.

23.49.  $f(x,y) = x^2 + 3y^2 + 2y$  funksiyaning  $x^2 + y^2 \leq 1$  doiradagi ekstremum qiyamatlarini toping.

23.50.  $f(x,y,z) = x - y + z$  funksiyaning  $x^2 + y^2 + z^2 = 1$  birlik sferadagi ekstremum qiyamatlarini toping.

**23.51.**  $f(x, y, z) = x(y + z)$  funksiyaning  $x^2 + y^2 = 1$  to‘g‘ri doiraviy konus va  $xz = 1$  giperbolik silindrлarning kesishish chizig‘idagi ekstremum qiyatlarini toping.

Quyidagi funksiyalarning ko‘rsatilgan  $D$  to‘plamda eng katta va eng kichik qiyatlarini toping.

$$23.52. u = x^3 - 3xy + y^3, D = \{(x, y) \in R^2 : 0 \leq x \leq 2, -1 \leq y \leq 2\}$$

$$23.53. u = x - 2y + 5, D = \{(x, y) \in R^2 : x \geq 0, y \geq 0, x + y \leq 1\}$$

$$23.54. u = x^2 - 4x - y^2, D = \{(x, y) \in R^2 : x^2 + y^2 \leq 9\}$$

$$23.55. u = xy(4 - x - y), D = \{(x, y) \in R^2 : x \geq 0, y \geq 0, x + y \leq 8\}$$

$$23.56. u = x^3 - 9xy + y^3 + 27, D = \{(x, y) \in R^2 : 0 \leq x \leq 4, 0 \leq y \leq 4\}$$

$$23.57. u = \sin x + \sin y + \sin(x + y), D = \{(x, y) \in R^2 : 0 \leq x \leq \pi/2, 0 \leq y \leq \pi/2\}$$

Quyidagi funksiyalarning ko‘rsatilgan  $D$  to‘plamda eng katta va eng kichik qiyatlarini toping:

$$23.58. u = xy + x + y, D = \{(x, y) \in R^2 : -2 \leq x \leq 2, -2 \leq y \leq 2\}$$

$$23.59. u = x^3 - 6xy + 8y^3 + 1, D = \{(x, y) \in R^2 : 0 \leq x \leq 2, -1 \leq y \leq 1\}$$

$$23.60. u = 3 + 2xy, D = \{(x, y) \in R^2 : -4 \leq x^2 + y^2 \leq 9\}$$

$$23.61. u = x^4 - y^4, D = \{(x, y) \in R^2 : x^2 + y^2 \leq 9\}$$

$$23.62. u = x^2 + y^2, D = \{(x, y) \in R^2 : (x - \sqrt{2})^2 + (y - \sqrt{2})^2 \leq 9\}$$

$$23.63. u = \cos x \cos y \cos(x + y), D = \{(x, y) \in R^2 : 0 \leq x \leq \pi, 0 \leq y \leq \pi\}$$

Berilgan funksiyalarning berilgan  $R$  sohada maksimum va minimum qiyatlarini toping.

**23.64.**  $f(x, y) = x^2 + xy + y^2 - 3x + 3y, R$ : birinchi kvadrantda  $x + y = 4$  to‘g‘ri chiziq bilan kesilgan uchburchakli soha.

**23.65.**  $f(x, y) = y^2 - xy - 3y + 2x, R$ :  $x = \pm 2$  va  $y = \pm 2$  to‘g‘ri chiziqlar bilan chegaralangan kvadratik soha.

**23.66.**  $f(x, y) = x^2 - y^2 - 2x + 4y, R$ : pastdan  $Ox$  o‘q, yuqoridan  $y = x + 2$  to‘g‘ri chiziq va o‘ngdan  $x = 2$  to‘g‘ri chiziq bilan chegaralangan uchburchakli soha.

**23.67.**  $f(x, y) = x^3 + y^3 + 3x^2 - 3y^2, R$ :  $x = \pm 1$  va  $y = \pm 1$  to‘g‘ri chiziqlar bilan chegaralangan kvadratik soha.

## 24-§. Oshkormas funksiyalar

24.1. **Oshkormas funksiya haqida tushuncha.** Faraz qilaylik,  $x$  va  $y$  o‘zgaruvchilarning qiymatlari, o‘zaro, ushbu

$$F(x, y) = 0 \tag{24.1}$$

tenglama orqali bog‘langan bo‘lsin. Bunda  $F(x, y)$ , ikki o‘zgaruvchining funksiyasi sifatida,  $\{M\} = \{(x, y) \in R^2 : a < x < b, c < y < d\}$  to‘plamda berilgan bo‘lsin. Biror  $x_0$  sonni ( $x_0 \in (a, b)$ ) olib, uni (24.1) tenglamadagi  $x$  ning o‘rniga qo‘ysak, natijada,  $y$  ni topish uchun, quyidagi

$$F(x_0, y) = 0 \tag{24.2}$$

tenglamaga ega bo‘lamiz. Bu tenglamani yechishda quyidagi hollar bo‘liishi mumkin:

- 1<sup>0</sup>. (24.2) tenglama yagona  $y_0$  yechimga ega ,  
 2<sup>0</sup>. (24.2) tenglama bitta ham yechimga ega emas ,  
 3<sup>0</sup>. (24.2) tenglama bir nechta, hatto, cheksiz ko‘p, yechimga ega bo‘lishi mumkin.

**Masalan:** 1)  $F(x, y) = \frac{x^2}{a^2} + \frac{y^2}{b^2} - 1 = 0$  tenglama  $[-a, a]$  kesmada  $y$  ni,  $x$  ning ikki qiymatli funksiyasi sifatida aniqlaydi:  $y = \pm \frac{b}{a} \sqrt{a^2 - x^2}$ . Buni  $F(x, y) = \frac{x^2}{a^2} + \frac{y^2}{b^2} - 1 = 0$  tenglamadagi  $y$  ning o‘rniga qo‘ysak, natijada ayniyat hosil bo‘ladi.

2)  $F(x, y) = y\sqrt{x^2 - 3} - 2 = 0$  tenglama,  $x$  ning  $R \setminus \{x \in R : -\sqrt{3} \leq x \leq \sqrt{3}\}$  dan olingan har bir qiyatida, yagona  $y = \frac{2}{\sqrt{x^2 - 3}}$  yechimga ega, bundan  $F\left(x, \frac{2}{\sqrt{x^2 - 3}}\right) = 0$ . Yuqoridagi keltirilgan 1) va 2) misollarda,  $y$  ni  $x$  orqali ifodalash mumkin bo‘ldi. Lekin, har doim ham bunday oson bo‘lavermaydi. Masalan, ushbu

$$F(x, y) = y - x - \varepsilon \sin y = 0 \quad (0 < \varepsilon < 1) \quad (24.3)$$

tenglamani qaraylik. Bunda  $y$  ni,  $x$  orqali elementar funksiyalar yordamida aniqlab bo‘lmaydi. Lekin,  $F(x, y) = y - x - \varepsilon \sin y = 0 \quad (0 < \varepsilon < 1)$  tenglama, umumiy holda,  $y$  ni,  $x$  ning bir qiyatli funksiyasi sifatida aniqlaydi. Haqiqatan ham, tenglamani  $x = y - \varepsilon \sin y = \varphi(y) \quad (y \in (-\infty; +\infty))$  ko‘rinishda yozib olib,  $\varphi(y)$  funksiyaning  $(-\infty; \infty)$  oraliqda uzlucksizligiga, hamda  $\varphi'(y) = 1 - \varepsilon \cos y > 0$  hosilaga ega ekanligiga ishonch hosil qilamiz. Unda, teskari funksiyaning mavjudligi to‘g‘risidagi teoremgaga asosan, yagona  $y = \varphi^{-1}(x)$  funksiya mavjud. (24.3) tenglama - Kepler tenglamasini ifodalaydi.

Demak, (24.3) tenglama, yagona  $y = \varphi^{-1}(x)$  yechimga ega, bunda  $F\left(x, \varphi^{-1}(x)\right) = 0$ .

3)  $F(x, y) = x^2 + y^2 - \ln y = 0 \quad (y > 0)$  tenglama,  $x$  ning  $(-\infty; \infty)$  oraliqdan olingan hech qanday qiyatida yechimga ega emas. Chunki, doimo  $y^2 - \ln y > 0$  munosabat o‘rinli. Bu holda berilgan tenglama bitta ham yechimga ega emas.

$F(x, y) = 0$  tenglama uchun, 1-holning o‘rinli bo‘lishi muhim ahamiyatga ega. Uning yordamida funksiya aniqlanishi mumkin.

$x$  o'zgaruvchining qiymatlaridan iborat,  $x$  ning undan olingan har bir qiymatida  $F(x, y) = 0$  tenglama yagona yechimga ega bo'lgan,  $x$  to'plamni qaraymiz.  $x$  to'plamdan ixtiyoriy  $x$  sonni olib, unga,  $F(x, y) = 0$  tenglamaning yagona yechimi bo'lgan,  $y$  ni mos qo'yamiz. Natijada,  $x$  to'plamdan olingan har bir  $x$  ga, yuqorida ko'rsatilgan qoidaga ko'ra, bitta  $y$  mos qo'yilib, funksiya hosil bo'ladi. Bunda  $x$  va  $y$  o'zgaruvchilar orasidagi bog'lanish,  $F(x, y) = 0$  tenglama yordamida ifodalangan bo'ladi. Odatda, bunday aniqlangan funksiya, *oshkormas funksiya* deyiladi va u  $x \rightarrow y : F(x, y) = 0$  kabi belgilanadi. Masalan, 2), 3) misollardagi oshkormas funksiyalar,

$$x \rightarrow y = \frac{2}{\sqrt{x^2 - 3}}, F\left(x, \frac{2}{\sqrt{x^2 - 3}}\right) = 0, \quad x \rightarrow y = \varphi^{-1}(x) : F\left(x, \varphi^{-1}(x)\right) = 0$$

kabi yoziladi.

**24.1-eslatma.** Agar  $F(x, y) = 0$  tenglama oshkormas ko'rinishdagi funksiyani aniqlamasa, ba'zi hollarda,  $y$  ga ma'lum shart qo'yish natijasida berilgan tenglama, oshkormas funksiyani aniqlashi mumkin. Masalan,  $F(x, y) = x^2 + y^2 - 1 = 0$  tenglama  $x$  ning  $(-1; 1)$  oraliqdan olingan har bir qiymatida, ikkita,  $y = -\sqrt{1-x^2}$ ,  $y = \sqrt{1-x^2}$  yechimlarga ega. Agar  $y$  ga, uning qiymatlari  $[-1, 0]$  kesmada bo'lsin, degan shart qo'yilsa, u holda, berilgan tenglama yordamida aniqlangan,

$$x \rightarrow y = -\sqrt{1-x^2}, F\left(x, -\sqrt{1-x^2}\right) = 0$$

ko'rinishdagi oshkormas funksiya hosil bo'ladi.

## 24.2. Oshkormas funksiyaning mavjudligi.

**24.1-teorema.**  $F(x, y)$  funksiya  $M_0(x_0, y_0) \in R^2$  nuqtaning biror  $U_{h,k}((x_0, y_0)) = \{(x, y) \in R^2 : x_0 - h < x < x_0 + h, y_0 - k < y < y_0 + k\}$  ( $h > 0, k > 0$ ) atrofida berilgan bo'lib, u quyidagi shartlarni qanoatlantirsin:

1)  $U_{h,k}((x_0, y_0))$  da uzliksiz;

2)  $x$  o'zgaruvchining  $(x_0 - h, x_0 + h)$  oraliqdan olingan har bir tayin qiymatida,  $y$  o'zgaruvchining funksiyasi sifatida, o'suvchi;

3)  $F(x_0, y_0) = 0$  bo'lsin.

U holda  $M_0(x_0, y_0)$  nuqtaning shunday

$U_{\delta,\varepsilon}((x_0, y_0)) = \{(x, y) \in R^2 : x_0 - \delta < x < x_0 + \delta, y_0 - \varepsilon < y < y_0 + \varepsilon\}$  ( $0 < \delta < h, 0 < \varepsilon < k$ ) atrofi topiladiki:

a)  $\forall x \in (x_0 - \delta, x_0 + \delta)$  uchun  $F(x, y) = 0$  tenglama, yagona  $y$  yechimga ( $y \in (y_0 - \varepsilon, y_0 + \varepsilon)$ ) ega, ya'ni  $F(x, y) = 0$  tenglama yordamida  $x \rightarrow y : F(x, y) = 0$  oshkormas ko'rinishdagi funksiya aniqlanadi;

b)  $x = x_0$  bo'lganda,  $y = y_0$  unga mos keladi;

c)  $x \rightarrow y : F(x, y) = 0$  oshkormas funksiya  $(x_0 - \delta, x_0 + \delta)$  oraliqda uzluksiz bo'ladi.

### 24.3. Oshkormas funksiyaning hosilasi.

**24.2-teorema.**  $F(x, y)$  funksiya  $M_0(x_0, y_0) \in R^2$  nuqtaning biror  $U_{n,k}((x_0, y_0)) = \{(x, y) \in R^2 : x_0 - h < x < x_0 + h, y_0 - k < y < y_0 + k\}$  ( $h > 0, k > 0$ ) atrofida berilgan bo'lib, u quyidagi shartlarni qanoatlantirsin:

1)  $U_{n,k}((x_0, y_0))$  da uzluksiz;

2)  $U_{n,k}((x_0, y_0))$  da uzluksiz  $F'_x(x, y), F'_y(x, y)$  xususiy hosilalarga ega va  $F'_y(x_0, y_0) \neq 0$ ;

3)  $F(x_0, y_0) = 0$ .

U holda,  $M_0(x_0, y_0)$  nuqtaning shunday

$U_{s,\varepsilon}((x_0, y_0)) = \{(x, y) \in R^2 : x_0 - \delta < x < x_0 + \delta, y_0 - \varepsilon < y < y_0 + \varepsilon\}$  ( $0 < \delta < h, 0 < \varepsilon < k$ ) atrofi topiladiki:

a)  $\forall x \in (x_0 - \delta, x_0 + \delta)$  uchun  $F(x, y) = 0$  tenglama yagona,  $y$  Yechimga ( $y \in (y_0 - \varepsilon, y_0 + \varepsilon)$ ) ega, ya'ni,  $F(x, y) = 0$  tenglama yordamida,  $x \rightarrow y : F(x, y) = 0$  oshkormas funksiya aniqlanadi;

b)  $x = x_0$  bo'lganda,  $y = y_0$  unga mos keladi;

c)  $x \rightarrow y : F(x, y) = 0$  oshkormas ko'rinishda aniqlangan funksiya  $(x_0 - \delta, x_0 + \delta)$  oraliqda uzluksiz bo'ladi;

d) oshkormas ko'rinishdagi funksiya  $(x_0 - \delta, x_0 + \delta)$  oraliqda uzluksiz hosilaga ega bo'ladi va uning hosilasi

$$y'_{\pm} = -\frac{F_x(x, y)}{F_y(x_0, y_0)} \quad (24.4)$$

formula bo'yicha hisoblanadi.

$F(x, y)$  funksiya,  $U_{s,\varepsilon}((x_0, y_0))$  atrofda uzluksiz ikkinchi tartibli

$F'_x(x, y), F'_{xy}(x, y), F'_{yy}(x, y)$  hususiy hosilalarga ega bo'lsin.  $y$  ning  $x$  ga bog'liqligini e'tiborga olib, (24.4) tenglikni  $x$  bo'yicha differensiallab, quyidagini topamiz:

$$y'' = \frac{2F'_x F'_y F'_{xy} - F'^2_y F'_{x^2} - F'^2_x F'_{y^2}}{(F'_y)^3}.$$

Xuddi shunday, oshkormas ko‘rinishdagi funksiyaning uchinchi va hokazo tartibdagi hosilalari topiladi.

#### 24.4. Ko‘p o‘zgaruvchili oshkormas funksiyalar.

$F(x, y) = F(x_1, x_2, \dots, x_m, y)$  ( $x = (x_1, x_2, \dots, x_m) \in R^m$ ) funksiya

$$\{M\} = \{(x, y) \in R^{m+1} : a_1 < x_1 < b_1, a_2 < x_2 < b_2, \dots, a_m < x_m < b_m, c < y < d\}$$

to‘plamda aniqlangan bo‘lsin. Ushbu

$$F(x, y) = F(x_1, x_2, \dots, x_m, y) = 0 \quad (24.5)$$

tenglamani qaraymiz.  $x \in R^m$  nuqtalardan iborat, undan olingan har bir  $x$  nuqtada (24.5) tenglama yagona haqiqiy yechimga ega bo‘lgan,  $X$  ( $X \subset R^m$ ) to‘plamni qaraymiz.  $x$  to‘plamdan ixtiyoriy  $x$  nuqtani olib, unga (24.5) tenglamaning yagona haqiqiy yechimi  $y$  ni mos qo‘yamiz. Natijada,  $x$  to‘plamdan olingan har bir  $x$  nuqtaga, yuqorida ko‘rsatilgan qoidaga ko‘ra, bitta  $y$  mos qo‘yilib, funksiya hosil qilinadi. Bunday aniqlangan funksiya, ko‘p o‘zgaruvchili ( $m$  o‘zgaruvchili) *oshkormas ko‘rinishda aniqlangan funksiya* deb ataladi va u,

$$x = (x_1, x_2, \dots, x_m) \rightarrow y : F(x_1, x_2, \dots, x_m, y) = 0$$

kabi belgilanadi.

**24.3-teorema.**  $F(x, y) = F(x_1, x_2, \dots, x_m, y)$  funksiya  $(x^0, y_0) \in R^{m+1}$  nuqtanining biror

$$U_{h_1, h_2, \dots, h_m, k} (x^0, y_0) = \{(x, y) \in R^{m+1} : x_1^0 - h_1 < x_1 < x_1^0 + h_1, x_2^0 - h_2 < x_2 < x_2^0 + h_2, \dots, x_m^0 - h_m < x_m < x_m^0 + h_m, y_0 - k < y < y_0 + k\} \quad (h_i > 0, i = 1, 2, \dots, m, k > 0)$$

atrofida aniqlangan va u quyidagi shartlarni qanoatlantirsin:

1)  $U_{h_1, h_2, \dots, h_m, k} (x^0, y_0)$  da uzluksiz;

2)  $x = (x_1, x_2, \dots, x_m)$  o‘zgaruvchining

$$\{x \in R^m : x_1^0 - h_1 < x_1 < x_1^0 + h_1, x_2^0 - h_2 < x_2 < x_2^0 + h_2, \dots, x_m^0 - h_m < x_m < x_m^0 + h_m\}$$

to‘plamdan olingan har bir tayin qiymatlarida,  $y$  o‘zgaruvchining funksiyasi sifatida, o‘suvchi (kamayuvchi);

3)  $F(x^0, y_0) = 0$ . U holda,  $(x^0, y_0) \in R^{m+1}$  nuqtanining shunday

$$U_{\delta_1, \delta_2, \dots, \delta_m, \varepsilon} (x^0, y_0) = \{(x, y) \in R^{m+1} : x_1^0 - \delta_1 < x_1 < x_1^0 + \delta_1, x_2^0 - \delta_2 < x_2 < x_2^0 + \delta_2, \dots, x_m^0 - \delta_m < x_m < x_m^0 + \delta_m, y_0 - \varepsilon < y < y_0 + \varepsilon\} \quad (0 < \delta_i < h_i, i = 1, 2, \dots, m, 0 < \varepsilon < k)$$

atrofi topiladiki: a)  $\forall x \in \{(x_1, x_2, \dots, x_m) \in R^m : x_1^0 - \delta_1 < x_1 < x_1^0 + \delta_1,$

$x_2 - \delta < x_2 < x_2^0 + \delta_2, \dots, x_m^0 - \delta_m < x_m < x_m^0 + \delta_m\}$  uchun,  $F(x, y) = 0$  tenglama,

b) ( $y \in (y_0 - \varepsilon, y_0 + \varepsilon)$ ) yagona haqiqiy yechimga ega, ya’ni (24.5) tenglama,

$x = (x_1, x_2, \dots, x_m) \rightarrow y : F(x_1, x_2, \dots, x_m, y) = 0$  oshkormas ko‘rinishdagi funksiyani aniqlaydi;

b)  $x = x^0$  bo‘lganda,  $y = y_0$  unga mos keladi;

c) oshkormas ko'rinishda aniqlangan  $(x_1, x_2, \dots, x_m) \rightarrow y : F(x_1, x_2, \dots, x_m, y) = 0$  funksiya,  $\{(x_1, x_2, \dots, x_m) \in R^m : x_1^0 - \delta_1 < x_1 < x_1^0 + \delta_1, x_2 - \delta < x_2 < x_2^0 + \delta_2, \dots, x_m^0 - \delta_m < x_m < x_m^0 + \delta_m\}$  to'plamda uzluksiz bo'ladi.

**24.4-teorema.**  $F(x, y) = F(x_1, x_2, \dots, x_m, y)$  funksiya  $(x^0, y_0) \in R^{m+1}$  nuqtanining biror

$$U_{h_1, h_2, \dots, h_m, k}(x^0, y_0) = \{(x, y) \in R^{m+1} : x_1^0 - h_1 < x_1 < x_1^0 + h_1, x_2^0 - h_2 < x_2 < x_2^0 + h_2, \dots, x_m^0 - h_m < x_m < x_m^0 + h_m, y_0 - k < y < y_0 + k\} \quad (h_i > 0, i = 1, 2, \dots, m, k > 0)$$

atrofida aniqlangan bo'lib, u quyidagi shartlarni qanoatlantirsin:

1)  $U_{h_1, h_2, \dots, h_m, k}(x^0, y_0)$  da uzluksiz;

2)  $U_{h_1, h_2, \dots, h_m, k}(x^0, y_0)$  da  $F_{x_i}(x_1, x_2, \dots, x_m, y) (i = 1, 2, \dots, m), F_y(x_1, x_2, \dots, x_m, y)$

uzluksiz xususiy hosilalarga ega va  $F'_y(x, y) \neq 0$ ;

3)  $F(x^0, y_0) = 0$ .

U holda,  $(x^0, y_0) \in R^{m+1}$  nuqtanining shunday

$$U_{\delta_1, \delta_2, \dots, \delta_m, \varepsilon}(x^0, y_0) = \{(x, y) \in R^{m+1} : x_1^0 - \delta_1 < x_1 < x_1^0 + \delta_1, x_2^0 - \delta_2 < x_2 < x_2^0 + \delta_2, \dots, x_m^0 - \delta_m < x_m < x_m^0 + \delta_m, y_0 - \varepsilon < y < y_0 + \varepsilon\} \quad (0 < \delta_i < h_i, i = 1, 2, \dots, m, 0 < \varepsilon < k)$$

atrofi topiladiki:

a)

$\forall x \in \{(x_1, x_2, \dots, x_m) \in R^m : x_1^0 - \delta_1 < x_1 < x_1^0 + \delta_1, x_2 - \delta < x_2 < x_2^0 + \delta_2, \dots, x_m^0 - \delta_m < x_m < x_m^0 + \delta_m\}$  uchun,  $F(x, y) = 0$  tenglama,  $y (y \in (y_0 - \varepsilon, y_0 + \varepsilon))$  yagona haqiqiy yechimiga ega, ya'ni (24.5) tenglama,  $x = (x_1, x_2, \dots, x_m) \rightarrow y : F(x_1, x_2, \dots, x_m, y) = 0$  oshkormas ko'rinishdagi funksiyani aniqlaydi;

b)  $x = x^0$  bo'lganda,  $y = y_0$  unga mos keladi;

c) oshkormas ko'rinishda aniqlangan  $(x_1, x_2, \dots, x_m) \rightarrow y : F(x_1, x_2, \dots, x_m, y) = 0$  funksiya,

$\{(x_1, x_2, \dots, x_m) \in R^m : x_1^0 - \delta_1 < x_1 < x_1^0 + \delta_1, x_2 - \delta < x_2 < x_2^0 + \delta_2, \dots, x_m^0 - \delta_m < x_m < x_m^0 + \delta_m\}$  to'plamda uzluksiz bo'ladi.

d) oshkormas ko'rinishdagi funksiya uzluksiz xususiy hosilalarga ega bo'ladi.

**24.1-misol.** Ushbu

$$y^4 - 4x^2y^2 + \sin x = 0$$

tenglamadan  $y$  ni, oshkor shaklda,  $x$  orqali ifodalang.

Yechilishi.  $y^2 = z$  almashtirish olib,  $z^2 - 4x^2z + \sin x = 0$  kvadrat tenglamaga ega bo'lamiz. Bundan,  $y^2 = z_{1,2} = 2x^2 \pm \sqrt{4x^4 - \sin x}, y^2 > 0$  bo'lgani uchun, kvadrat ildiz oldidagi "+" ishorani olamiz:

$$y = \pm \sqrt{2x^2 + \sqrt{4x^4 - \sin x}}.$$

## 24.2-misol. Ushbu

$$y^2 - 2x^3y + x^6 - x^4 + x^2 = 0 \quad (24.6)$$

tenglama,  $y$  ni  $M_0(0,0)$  nuqta atrofida  $x$ ning bir qiymatli uzlusiz funksiyasi sifatida aniqlaydimi?

**Yechilishi.**  $F(x,y) = y^2 - 2x^3y + x^6 - x^4 + x^2$ ,  $F'_y = 2y - 2x^3$ . Bu hosila  $M_0(0,0)$  nuqtada  $F'_y(0;0) = 0$  bo'ldi. Demak, oshkormas funksiyaning mavjudligi va uzlusizligi haqidagi 24.1 - teoremaning shartlari bajarilmaydi. Shuning uchun, berilgan tenglama,  $M_0(0,0)$  nuqtanining atrofida oshkormas funksiyani aniqlamaydi. Haqiqatan ham, (24.6) tenglamani  $y$  ga nisbatan yechib,  $y = x^3 \pm x\sqrt{x^2 - 1}$  ni hosil qilamiz. Bu funksiyalar  $x = 0$  va  $|x| > 1$  da aniqlangan bo'lib,  $M_0(0,0)$  nuqtanining atrofida, (24.6) tenglamani qanoatlantiruvchi  $M_0(0,0)$  nuqtadan boshqa birorta ham nuqta mavjud emas.  $M_0(0,0)$  nuqta - egrini chiziqning yakkalangan nuqtasi bo'lar ekan.

## 24.3-misol. Ushbu

$$ye^x - x \ln y - 1 = 0$$

tenglama,  $x = 0$  nuqta atrofida, uzlusiz  $y = f(x)$  funksiyani aniqlaydimi? Agar aniqlasa, bu funksiya hosilaga egami? Agar hosilaga ega bo'lsa, uning hosilasini hisoblang.

**Yechilishi.**  $ye^x - x \ln y - 1 = 0$  tenglamaga  $x = 0$  qiymatni qo'yib,  $y = 1$  bo'lishini topamiz. Endi  $M_0(0,1)$  nuqta atrofida  $F(x,y) = ye^x - x \ln y - 1$  funksiyaning 24.2 - teoremaning shartlarini qanoatlantirishini tekshirib ko'ramiz:

1)  $F(x,y) = ye^x - x \ln y - 1$  funksiya,  $y > 0$  yarim tekislikda aniqlangan, uzlusiz. Uning xususiy hosilalari mavjud va uzlusiz:

$$F'_x = ye^x - \ln y, F'_y = e^x - \frac{x}{y};$$

$$2) F'_y(0;1) = e^0 - \frac{0}{1} = 1 \neq 0.$$

Shunday qilib, 24.2-teoremaning shartlari bajariladi, shuning uchun  $ye^x - x \ln y - 1 = 0$  tenglama  $M(0,1)$  nuqtanining atrofida  $x \rightarrow y(x): ye^x - x \ln y - 1 = 0$  ko'rinishdagi oshkormas uzlusiz funksiyani aniqlaydi. Bu oshkormas funksiya, quyidagi uzlusiz hosilaga ega:

$$y' = -\frac{F'_x}{F'_y} = -\frac{ye^x - \ln y}{e^x - \frac{x}{y}} = -\frac{y(ye^x - \ln y)}{ye^x - x}.$$

**24.4-misol.** Ushbu  $xe^{2y} - y \ln x - 8 = 0$  oshkormas ko'rinishda berilgan funksiyaning birinchi va ikkinchi tartibli hosilalarini toping.

**Yechilishi.**  $xe^{2y} - y \ln x - 8 = 0$  tenglikni  $x$  bo'yicha ( $y$  ni  $x$  ning funksiyasi, deb qarab) ikki marta differensiallaymiz:

$$a) e^{2y} + xe^{2y} \cdot 2y' - y' \cdot \ln x - \frac{y}{x} = 0;$$

$$b) e^{2y} \cdot y' + e^{2y} \cdot 2y' + 2x(e^y \cdot (y')^2 + e^{2y} \cdot y') - y'' \cdot \ln x - \frac{y'}{x} - \frac{xy' - y}{x^2} = 0.$$

$$a) \text{ dan } y' = \frac{\frac{y}{x} - e^{2y}}{2xe^{2y} - \ln x} = \frac{e^{2y} - \frac{y}{x}}{\ln x - 2xe^{2y}}, \quad (24.7)$$

$$b) \text{ dan } y' = \frac{2xy(1 - xe^{2y} - x^2e^{2y} \cdot y')}{2xe^{2y} - \ln x} \quad (24.8)$$

Agar (24.8) da  $y'$  ning o'rniiga (24.7) dagi ifodani keltirib qo'ysak, natijada  $y'$  ning  $x$  va  $y$  orqali ifodasi topiladi.

**24.5-misol.** Ushbu  $z^3 - 3xyz = 8$  tenglamaning  $M_0(0;-1;2)$  nuqta atrofida, yagona,  $z = f(x, y)$  oshkormas funksiyani aniqlashini isbot qiling. Uning  $z'_x(0;-1)$  va  $z'_y(0;-1)$  xususiy hosilalarni toping.

**Yechilishi.**  $F(x, y, z) = z^3 - 3xyz - 8$  funksiya  $M_0(0;-1;2)$  nuqta atrofida differensiallanuvchi. Uning  $F_x = 3z^2 - 3yz = 3(z^2 - xy)$  hosilasi  $M_0(0;-1;2)$  nuqtada uzlusiz, hamda  $F(0;-1;2) = 0$ ,  $F_z(0;-1;2) = 12 \neq 0$ . Demak, 24.4 - teoremaning hamma shartlari bajariladi. Shuning uchun, berilgan tenglama,  $M_0(0;-1;2)$  nuqtada yagona, differensiallanuvchi,  $z = f(x, y)$  ko'rinishdagi oshkormas funksiyani aniqlaydi.

$z = f(x, y)$  funksiyaning  $(0;-1)$  nuqtadagi qiymatini hisoblaymiz:

$$z^3 - 3 \cdot 0 \cdot (-1) \cdot z - 8 = 0, z^3 = 8, z = 2.$$

Endi  $z^3 - 3xyz = 8$  tenglamani, mos ravishda,  $x$  va  $y$  bo'yicha differensiallaymiz:

$$3z^2 \cdot z'_x - 3yz - 3xyz'_x = 0, \quad (24.9)$$

$$3z^2 \cdot z'_y - 3xz - 3xz - 3xy \cdot z'_y = 0 \quad (24.10)$$

(24.9) ga  $x = 0, y = -1, z = 2$  qiymatlarni keltirib qo'yib,

$$3 \cdot 4 \cdot z'_x - 3 \cdot (-1) \cdot 2 - 3 \cdot 0 \cdot (-1) \cdot z'_x = 0, z'_x = -0,5$$

bo'lishini topamiz.

(24.10) ga  $x = 0, y = -1, z = 2$  qiymatlarni keltirib qo'yib,

$$3 \cdot 4 \cdot z'_y - 3 \cdot (-1) \cdot 2 - 3 \cdot 0 \cdot (-1) \cdot z'_y = 0, z'_y = 0$$

ekanligini topamiz.

**24.6-misol.** Ushbu  $\cos^2 x + \cos^2 y + \cos^2 z = 1$  tenglama bilan aniqlangan  $z(x, y)$  oshkormas funksiyaning xususiy hosilalarini va to'liq differensialini toping.

**Yechilishi.**  $\cos^2 x + \cos^2 y + \cos^2 z - 1 = 0$  tenglamani, mos ravishda,  $x$  va  $y$  bo'yicha ( $z$  ni  $x$  va  $y$  ning funksiyasi, deb qarab) differensialaymiz:

$$-2\cos x \cdot \sin x - 2\cos z \cdot \sin z \cdot z'_x = 0$$

$$-2\cos y \cdot \sin y - 2\cos z \cdot \sin z \cdot z'_y = 0.$$

Bu tenglamalardan,  $z'_x = -\frac{\sin 2x}{\sin 2z}$ ,  $z'_y = -\frac{\sin 2y}{\sin 2z}$  xususiy hosilalarni topamiz. Ikki o'zgaruvchili funksianing to'liq differensialini topish formulasiga asosan,

$$dz = z'_x dx + z'_y dy = -\frac{\sin 2x dx + \sin 2y dy}{\sin 2z}.$$

**24.7-misol.** Ushbu  $x^2 + y^2 + z^2 = 2z$  tenglama bilan aniqlangan  $z(x, y)$  funksianing xususiy hosilalari, birinchi va ikkinchi tartibli to'liq differensiallarini toping.

**Yechilishi.**  $x^2 + y^2 + z^2 = 2z$  tenglamani, mos ravishda,  $x$  va  $y$  bo'yicha differensialaymiz:

$$2x + 2z \cdot z'_x - 2z'_x = 0, \quad (24.11)$$

$$2y + 2z \cdot z'_y - 2z'_y = 0. \quad (24.12)$$

$$\text{Bundan, } z'_x = -\frac{x}{z-1}, \quad z'_y = -\frac{y}{z-1}, \quad dz = \frac{xdx + ydy}{1-z}.$$

(24.11), (24.12) larni, mos ravishda,  $x$  va  $y$  bo'yicha differensialaymiz:

$$1 + (z'_x)^2 + z \cdot z''_x - z''_{x^2} = 0,$$

$$1 + (z'_y)^2 + z \cdot z''_y - z''_{y^2} = 0.$$

Bu tenglamalardan,

$$z''_{x^2} = \frac{1 + (z'_x)^2}{1-z} = \frac{1 + \frac{x^2}{(1-z)^2}}{(1-z)} = \frac{(1-z)^2 + x^2}{(1-z)^3},$$

$$z''_{y^2} = \frac{(1-z)^2 + y^2}{(1-z)^3}.$$

(24.11) ni  $y$  bo'yicha, (24.12) ni  $x$  bo'yicha differensiallab,  $z'_{xy} = \frac{xy}{(1-z)^3}$ ,  $z''_{xy} = \frac{xy}{(1-z)^3}$  aralash hosilalarni topamiz. Ikki o'zgaruvchili funksianing ikkinchi tartibli differensialini topish qoidasiga asosan,

$$\begin{aligned} d^2z &= \left( \frac{\partial}{\partial x} dx + \frac{\partial}{\partial y} dy \right)^2 z = \frac{\partial^2 z}{\partial x^2} dx^2 + 2 \frac{\partial^2 z}{\partial x \partial y} dxdy + \frac{\partial^2 z}{\partial y^2} dy^2 = \\ &= \frac{(1-z)^2 + x^2}{(1-z)^3} dx^2 + \frac{2xy}{(1-z)^3} dxdy + \frac{(1-z)^2 + y^2}{(1-z)^3} dy^2. \end{aligned}$$

**24.5. Tenglamalar sistemasi bilan aniqlanadigan oshkormas funksiyalar.** Ushbu  $F_i(u_1, u_2, \dots, u_n, x_1, x_2, \dots, x_m)$  ( $i = \overline{1, n}$ ) funksiyalar biror  $D = \{(u_1, u_2, \dots, u_n, x_1, x_2, \dots, x_m) \in R^{n+m} : a_1 < x_1 < b_1, \dots, a_m < x_m < b_m, c_1 < u_1 < d_1, \dots, c_n < u_n < d_n\}$  to‘plamda berilgan bo‘lsin.

$$\left. \begin{array}{l} F_1 = F_1(u_1, u_2, \dots, u_n, x_1, x_2, \dots, x_m) = 0, \\ F_2 = F_2(u_1, u_2, \dots, u_n, x_1, x_2, \dots, x_m) = 0, \\ \dots \\ F_n = F_n(u_1, u_2, \dots, u_n, x_1, x_2, \dots, x_m) = 0 \end{array} \right\} \quad (24.13)$$

tenlamalar sistemasini qaraymiz.  $x = (x_1, x_2, \dots, x_m)$  o‘zgaruvchining qiymatlaridan iborat, undan olingan har bir  $x = (x_1, x_2, \dots, x_m)$  nuqtada (24.13) sistema yagona  $u_1, u_2, \dots, u_n$  yechimlar sistemasiga ega bo‘lgan,  $D_x = \{x \in R^m : a_1 < x_1 < b_1, \dots, a_m < x_m < b_m\} \subset R^m$  to‘plamni qaraymiz.  $D_x$  to‘plamdan olingan ixtiyoriy  $x = (x_1, x_2, \dots, x_m)$  nuqtani olib, unga (24.13) sistemaning yagona,  $u_1, u_2, \dots, u_n$  yechimlar sistemasini mos qo‘yamiz. Natijada,  $D_x$  to‘plamdan olingan har bir  $x$  nuqtaga, yuqorida ko‘rsatilgan qoidaga ko‘ra,  $u_1, u_2, \dots, u_n$  lar mos qo‘yilib,  $n$  ta funksiya hosil bo‘ladi. Bunday aniqlangan funksiyalar, (24.13) tenglamalar sistemasi yordamida aniqlangan *oshkormas funksiyalar sistema* deb ataladi.

**24.5-teorema.**  $F_i$  ( $i = \overline{1, n}$ ) funksiyalarning har biri,

$(u^0, x^0) = (u_1^0, u_2^0, \dots, u_n^0, x_1^0, x_2^0, \dots, x_m^0)$  nuqtanining biror

$$U_{k_1, k_2, \dots, k_m}(u^0, x^0) = U_{k_1, k_2, \dots, k_m, h_1, h_2, \dots, h_m}(x^0, y_0) =$$

$$= \{(u, x) \in R^{n+m} : u_1^0 - k_1 < u_1 < u_1^0 + k_1, u_2^0 - k_2 < u_2 < u_2^0 + k_2, \dots, u_m^0 - k_m < u_m < u_m^0 + k_m,$$

$$x_1^0 - h_1 < x_1 < x_1^0 + h_1, x_2^0 - h_2 < x_2 < x_2^0 + h_2, \dots, x_m^0 - h_m < x_m < x_m^0 + h_m\}$$

$$(h_i) > 0, i = 1, 2, \dots, m, k_j > 0, j = 1, 2, \dots, n$$

atrofida aniqlangan bo‘lib, ular quyidagi shartlarni qanoatlantirsin:

1)  $U_{k_m}(u^0, x^0)$  da uzlusiz;

2)  $U_{k_m}(u^0, x^0)$  da barcha xususiy hosilalarga ega va ular uzlusiz;

3) xususiy hosilalarning  $(u^0, x^0)$  nuqtadagi qiymatlaridan tuzilgan determinat nuldan farqli:

$$\left| \begin{array}{ccc} \frac{\partial F_1}{\partial u_1} & \frac{\partial F_1}{\partial u_2} & \dots & \frac{\partial F_1}{\partial u_n} \\ \frac{\partial F_2}{\partial u_1} & \frac{\partial F_2}{\partial u_2} & \dots & \frac{\partial F_2}{\partial u_n} \\ \dots & \dots & \dots & \dots \\ \frac{\partial F_n}{\partial u_1} & \frac{\partial F_n}{\partial u_2} & \dots & \frac{\partial F_n}{\partial u_n} \end{array} \right| \neq 0;$$

4)  $(u^0, x^0)$  nuqtada  $F_i(u^0, x^0) = 0 \quad (i = \overline{1, n})$ .

U holda,  $(u^0, x^0)$  nuqtaning shunday  $U_{\delta, \varepsilon}((u^0, x^0)) = U_{\delta_1 \delta_2 \dots \delta_n; \varepsilon_1 \varepsilon_2 \dots \varepsilon_n}((u^0, x^0))$   
 $(0 < \delta_i < n_i < h_i, i = \overline{1, m}, 0 < \varepsilon_j < k_j, j = \overline{1, n})$  atrofi topiladi, bu atrofda:

a) (24.5) sistema, oshkormas funksiyalar sistemasini aniqlaydi, ularni  $u_i = f_i(x_1, x_2, \dots, x_m)$ ,  $i = \overline{1, n}$  orqali belgilaymiz;

b)  $x = x^0$  nuqtada  $f_i(x^0) = y^0, i = \overline{1, n}$ , bo'ladi;

c) oshkormas ko'rinishda aniqlangan  $f_i (i = \overline{1, n})$  funksiyalar  $\{x \in R^m : x_1^0 - \delta_1 < x_1 < x_1^0 + \delta_1, \dots, x_m^0 - \delta_m < x_m < x_m^0 + \delta_m\}$  to'plamda uzliksiz va uzliksiz xususiy hosilalarga ega bo'ladi.

#### 24.8-misol. Ushbu

$$\begin{cases} x + y = u + v \\ xy + yv = 1 \end{cases}$$

sistema,  $(1; 1; 2, 0)$  nuqtaning atrofida, oshkormas funksiyalarni aniqlaydimi?

**Yechilishi.** Ravshanki,  $F_1(x, y, u, v) = x + y - u - v, F_2(x, y, u, v) = xy + yv - 1$  funksiyalar  $(1; 1; 2, 0)$  nuqtaning atrofida uzliksiz hamda barcha

$$\frac{\partial F_1}{\partial x} = 1, \frac{\partial F_1}{\partial y} = 1, \frac{\partial F_1}{\partial u} = -1, \frac{\partial F_1}{\partial v} = -1,$$

$$\frac{\partial F_2}{\partial x} = y, \frac{\partial F_2}{\partial y} = v, \frac{\partial F_2}{\partial u} = 0, \frac{\partial F_2}{\partial v} = y$$

xususiy hosilalarga ega va ular ham uzliksiz.  $(1; 1; 2, 0)$  nuqtada

$$\begin{vmatrix} \frac{\partial F_1}{\partial u} & \frac{\partial F_1}{\partial v} \\ \frac{\partial F_2}{\partial u} & \frac{\partial F_2}{\partial v} \end{vmatrix} = \begin{vmatrix} -1 & -1 \\ 0 & 1 \end{vmatrix} = -1 \neq 0, \quad F_1(1, 1; 2, 0) = 0, \quad F_2(1, 1; 2, 0) = 0.$$

Demak, 24.5-teoremgaga ko'ra, berilgan sistema,  $u$  va  $v$  larni,  $x$  va  $y$  o'zgaruvchilarning funksiyasi sifatida aniqlaydi:

$$u = 2x + y - \frac{1}{y}, \quad v = \frac{1}{y} - x.$$

**24.8-misol.**  $u(x, y)$  va  $v(x, y)$  oshkormas funksiyalar, ushbu

$$\begin{cases} xu + yv = 4, \\ yu - v = 0 \end{cases}$$

sistema orqali aniqlangan. Agar  $x = 1, y = -1$  da  $u(x, y)$  va  $v(x, y)$  funksiyalar  $u(1; -1) = 2, v(1; -1) = -2$  qiymatlarni qabul qilsa, u holda ularning barcha xususiy hosilalari, birinchi va ikkinchi tartibli to'liq differensiallarini toping.

**Yechilishi.** Berilgan sistemani ikki marta differensiallaymiz:

$$\begin{cases} udx + xdu + vdy + ydv = 0, \\ udy + ydu - dv = 0. \end{cases} \quad (24.14)$$

$$\begin{cases} dudx + dxdu + xd^2u + dydy + dydv + yd^2v = 0, \\ dudy + dydy + yd^2u - d^2v = 0. \end{cases} \quad (24.15)$$

(24.14) sistemaga  $x=1, y=-1, u=2, v=-2$  qiymatlarni keltirib qo'yib,

$$\begin{cases} 2dx + du - 2dy - dv = 0, \\ 2dy - du - dv = 0. \end{cases} \text{ yoki } \begin{cases} dv = dx \\ du = 2dy - dx \end{cases}$$

ekanligini topamiz. Bundan,  $\frac{\partial v}{\partial x} = 1, \frac{\partial v}{\partial y} = 0, \frac{\partial u}{\partial x} = -1, \frac{\partial u}{\partial y} = 2$ . Xuddi

shunday,  $x=1, y=-1, u=2, v=-2$  qiymatlarni, hamda  $dv$  va  $du$  larning, yuqorida topilgan, qiymatlarini (24.15) sistemaga keltirib qo'yib,

$$\begin{cases} 2dx(2dy - dx) + d^2u + 2dxdy - d^2v = 0, \\ 2dy(2dy - dx) - d^2u - d^2v = 0. \end{cases} \text{ yoki } \begin{cases} 6dxdy - 2(dx)^2 + d^2u - d^2v = 0, \\ 4(dy)^2 - 2dxdy - d^2u - d^2v = 0 \end{cases}$$

bo'lishini topamiz. Bundan,

$$\begin{aligned} d^2u - d^2v &= 2(dx)^2 - 6dxdy, & d^2u &= (dx)^2 + 4dxdy - 2(dy)^2, \\ d^2u + d^2v &= 4(dy)^2 - 2dxdy, & d^2v &= -(dx)^2 + 2dxdy + 2(dy)^2. \end{aligned}$$

Demak, ikki o'zgaruvchili funksiyaning ikkinchi tartibili differensialini topish formulasini e'tiborga olsak,  $\frac{\partial^2 u}{\partial x^2} = 1, \frac{\partial^2 u}{\partial x \partial y} = 2, \frac{\partial^2 v}{\partial x^2} = -1, \frac{\partial^2 v}{\partial x \partial y} = 1, \frac{\partial^2 v}{\partial y^2} = 2$  larni topamiz.

### Mustaqil yechish uchun misollar

Quyidagi tenglamalarni  $y$  ga nisbatan yechib,  $x$  ning funksiyasi sifatida ifodalang:

$$24.1. y^2 - 5x^2y + 4x^4 = 0.$$

$$24.2. y^4 - 4x^2y^2 + \sin x = 0.$$

$$24.3. e^{x^2+y^3} - x^8 - 6 = 0.$$

$$24.4. x^2y^4 - 3y^3 + 6x^3y^2 - 3y + x^2 = 0.$$

24.2. Quyidagi tenglamalar sistemasini,  $y$  va  $z$  larga nisbatan yechib,  $x$  ning funksiyasi sifatida ifodalang:

$$24.5. \begin{cases} y+z=x^2, \\ y^2-yz+z^2=6x. \end{cases}$$

$$24.6. \begin{cases} yz=x^4, \\ y+z+x(y^2+z^2)=3x-1. \end{cases}$$

Quyidagi tenglamalar, ko'rsatilgan nuqta atrofida, oshkormas funksiyani aniqlaydimi?

$$24.7. F(x, y) = y^4 + xy + y^3 - 3 = 0, A(1; 1).$$

$$24.8. F(x, y) = x^3 - 3axy + y^3 = 0, A(a \sqrt[3]{4}; a \sqrt[3]{2}).$$

$$24.9. F(x, y) = e^y + y \sin x - x^3 + 7 = 0, A(2; 0).$$

$$24.10. F(x, y) = x(x^2 + y^2) - a(x^2 - y^2), A(0; 0).$$

Quyidagi oshkormas ko‘rinishda berilgan funksiyalarning berilgan nuqtada  $f_x$ ,  $f_y$  xususiy hosilalarini hisoblang:

$$24.11. u^3 - 2u^2x + uxy - 2 = 0, \quad A(1; 1). \quad 24.12. u^3 + 3uxy + 1 = 0, \quad A(0; 1).$$

$$24.13. e^u - xyu - 2 = 0 \quad A(1; 0). \quad 24.14. u + \ln(x + y - u) = 0, \quad A(1; -1).$$

Quyidagi oshkormas ko‘rinishdagi funksiyalarning birinchi tartibli hosilasining berilgan nuqtadagi qiymatini toping:

$$24.15. x^3 - 2y^2 + xy = 0, \quad (1; 1). \quad 24.16. x^2 + xy + y^2 - 7 = 0, \quad (1; 2).$$

Quyidagi oshkormas ko‘rinishda berilgan funksiyalarning birinchi va ikkinchi tartibli hosilalarini hisoblang:

$$24.17. x^2 - y^2 - 4 = 0. \quad 24.24. 1 + xy - \ln(e^{xy} + e^{-xy}) = 0.$$

$$24.19. 2\cos(x - 2y) - 2y + x = 0. \quad 24.20. x^3 + y^3 - 3xy = 0.$$

Quyidagi oshkormas ko‘rinishdagi funksiyalarning birinchi tartibli hosilasining berilgan nuqtadagi qiymatini toping:

$$24.21. z^3 - xy + yz + y^3 - 2 = 0, \quad (1; 1; 1).$$

$$24.22. \sin(x+y) + \sin(y+z) + \sin(x+z) = 0, \quad (\pi; \pi; \pi).$$

Quyidagi oshkormas ko‘rinishda berilgan funksiyalarning birinchi tartibli xususiy hosilalarini va to‘liq differensiallarini hisoblang:

$$24.23. x^2 + y^2 + z^2 - 6x = 0. \quad 24.24. x^2 + y^2 + z^2 - 2xz = a^2.$$

$$24.25. z^2 - xy = 0. \quad 24.26. z^3 + 3x^2z - 2xy = 0.$$

Quyidagi oshkormas ko‘rinishda berilgan funksiyalarning birinchi va ikkichi tartibli to‘liq differensiallarini hisoblang:

$$24.27. x^2 + y^2 + z^2 - 2z = 0. \quad 24.28. z^3 - 3xyz = a^3. \quad 24.29. 3) x - z \ln \frac{x}{y} = 0.$$

24.30.  $u(x, y)$  va  $v(x, y)$  oshkormas ko‘rinishdagi funksiyalar, ushbu  $\begin{cases} u + v = x, \\ u - yv = 0 \end{cases}$  sistema orqali aniqlangan.  $u(x, y)$  va  $v(x, y)$  oshkormas ko‘rinishdagi funksiyalarning birinchi va ikkinchi tartibli to‘liq differensiallarini hisoblang.

24.31.  $u(x, y)$  va  $v(x, y)$  oshkormas ko‘rinishdagi funksiyalar, ushbu  $\begin{cases} xu + yv = 1, \\ y + x + u + v = 0 \end{cases}$  sistema orqali aniqlangan.  $u(x, y)$  va  $v(x, y)$  oshkormas ko‘rinishdagi funksiyalarning birinchi va ikkinchi tartibli to‘liq differensiallarini hisoblang.

24.32.  $u(x, y)$  va  $v(x, y)$  oshkormas ko‘rinishdagi funksiyalar, ushbu  $\begin{cases} u + v = x + y, \\ y \sin u - x \sin v = 0 \end{cases}$  sistema orqali aniqlangan.  $u(x, y)$  va  $v(x, y)$  oshkormas ko‘rinishdagi funksiyalarning birinchi va ikkinchi tartibli to‘liq differensiallarini hisoblang.

## BA'ZI MUHIM CHIZIQLAR VA SIRTLAR

### 1. Parabola

1-chizma.  $y = ax^2$ , (1) –  $a > 0$ , (2) –  $a < 0$ .

2-chizma.  $ay^2 = x$ , (1) –  $a > 0$ , (2) –  $a < 0$ .

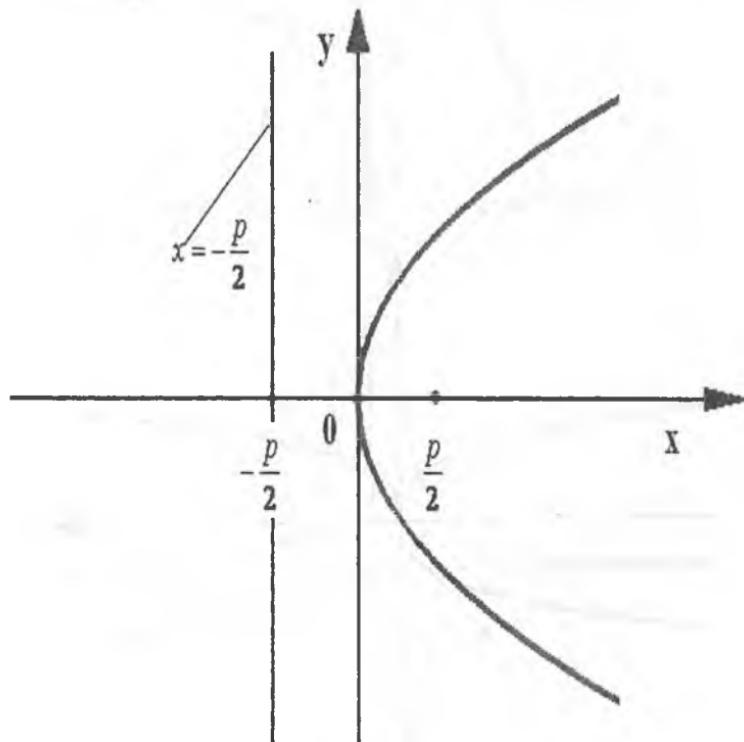

Parabolaning tenglamalari (3-chizma):

1) to‘g‘ri burchakli koordinatalar sistemasida  $y^2 = 2px$  ;

2) qutb koordinatalar sistemasida  $\rho = \frac{p}{1 - \cos \varphi}$  ;

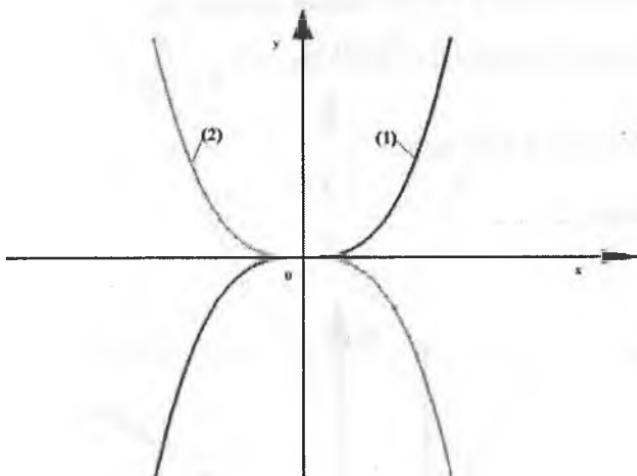

3) parametrik ko‘rinishda  $\begin{cases} x = \frac{t}{2p} \\ y = t \end{cases}$

kabi ifodalanadi.

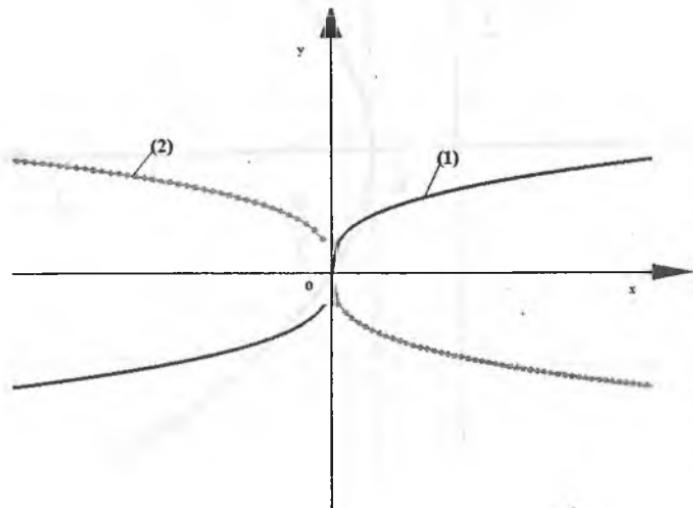

3-chizma.

## 2. Kubik parabola

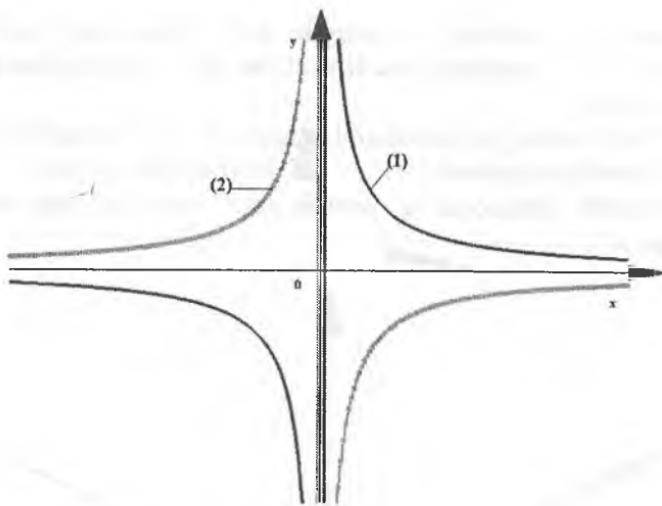

4-chizma.  $y = ax^3$ , (1)  $-a > 0$ , (2)  $-a < 0$ .

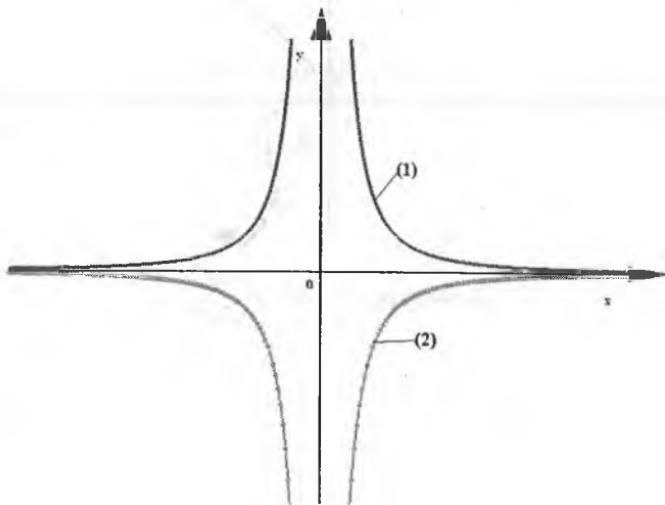

5-chizma.  $ay^3 = x$ , (1)  $-a > 0$ , (2)  $-a < 0$ .

### 3. Giperbolik funksiya

6-chizma.  $y = \frac{a}{x}$ , (1) -  $a > 0$ , (2) -  $a < 0$ .

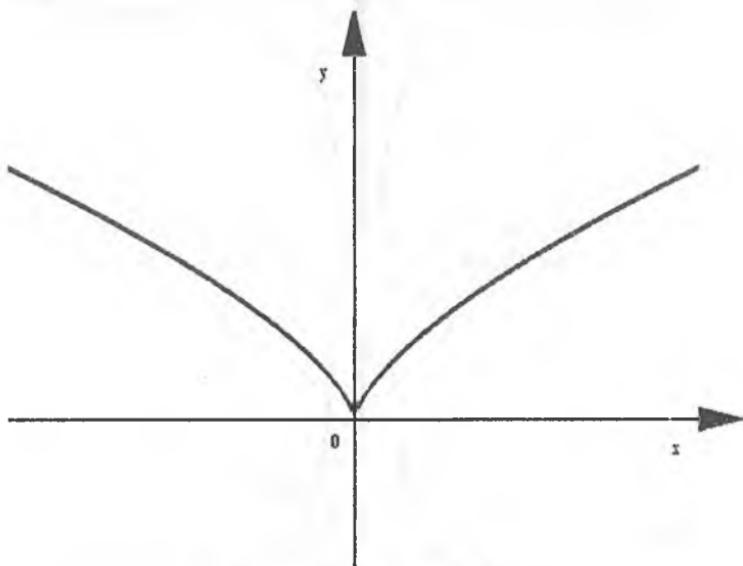

7-chizma.  $y = \frac{a}{x^2}$ , (1) -  $a > 0$ , (2) -  $a < 0$ .

#### 4. Neyl parabolasi (Yarimkubik parabola)

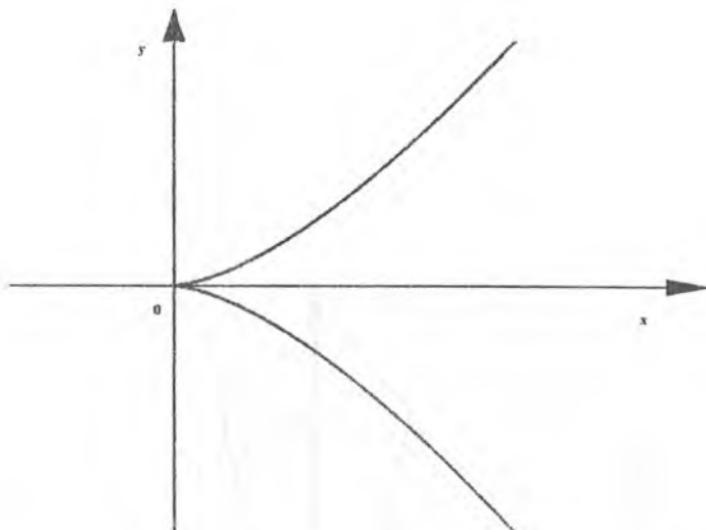

Yarimkubik parabola – qandaydir to‘g‘ri burchakli koordinatalar sistemasida  $y^2 = ax^3$  tenglama orqali ifodalangan – tekis algebraik to‘g‘ri chiziqdan iborat.

1657 yilda uning yoy uzunligini topgan olim Neyl nomi bilan ataladi. Uning parametrik tenglamasi  $x=t^2$ ,  $y=at^3$  ko‘rinishda yoziladi.

Yarimkubik parabolaning koordinatalar boshidagi egrilik radiusi nolga teng.

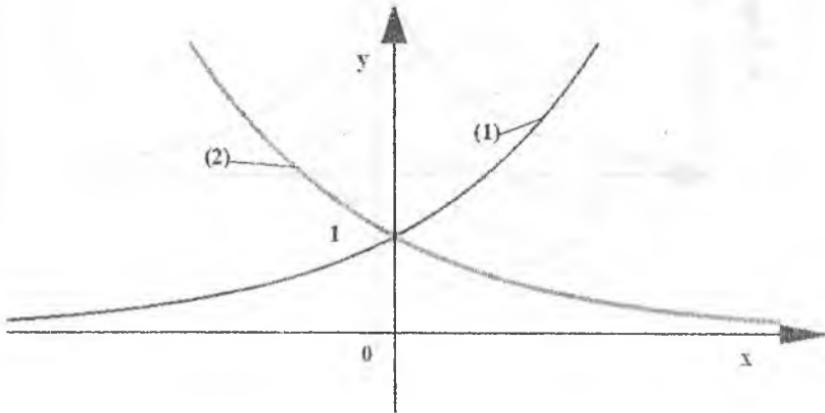

$$\text{8-chizma. } y^3 = x^2. \quad \begin{cases} x = t^3 \\ y = t^2 \end{cases}$$

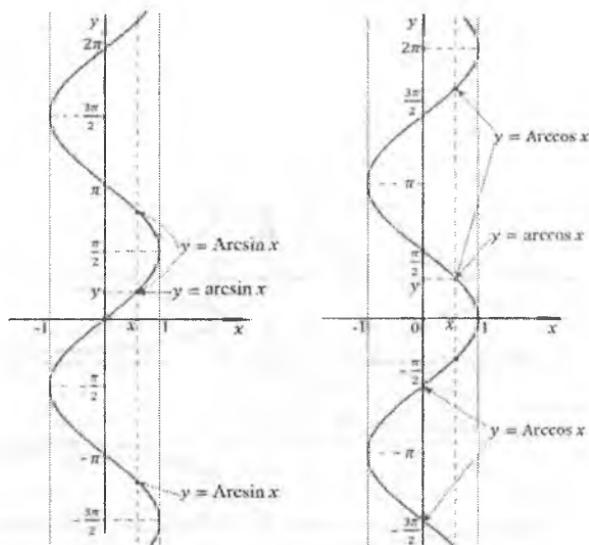

9-chizma.  $y^2 = x^3$ .  $\left. \begin{array}{l} x=t^2 \\ y=t^3 \end{array} \right\}$

### 5. Ko'satgichli funksiya

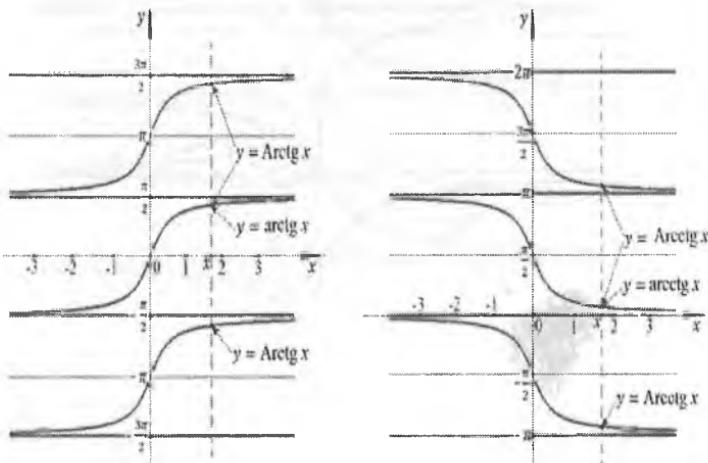

10-chizma.  $y = a^x$ , (1) –  $a > 1$ , (2) –  $0 < a < 1$ .

## 10. Teskari trigonometrik funksiyalar

15-chizma.  $y = \text{Arcsin } x$ ,  $y = \text{Arccos } x$ .

16-chizma.  $y = \text{Arctgx}$ ,  $y = \text{Arcctgx}$ .

## 11. Giperbolik sinus va giperbolik kosinus funksiyalar (Zanjirli chiziq)

**Zanjirli chiziq** – bir jinsli gravitasion maydonda uchlari mahkamlangan egiluvchan, bir jinsli va cho‘zilmaydigan og‘ir ip yoki zanjir hosil qiladigan chiziqdan iborat. U tekis transsendent chiziqdir.

Dekart koordinatalar sistemasidagi tenglamasi :

$$y = \frac{a}{2} \left( e^{\frac{x}{a}} + e^{-\frac{x}{a}} \right) = a \operatorname{ch} \frac{x}{a}$$

U quyidagi xossalarga ega :

- uning uchidan ixtiyoriy  $(x, y)$  nuqtasigacha bo‘lgan yoy uzunligi

$$S = a \operatorname{sh} \frac{x}{a} = \sqrt{y^2 - a^2}$$

formula orqali topiladi.

- uning egrilik radiusi

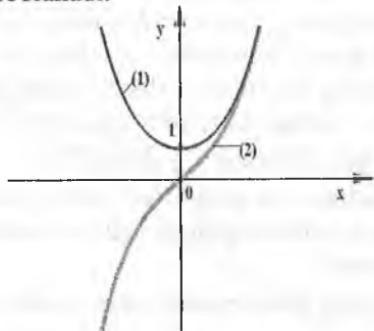

$$R = a \operatorname{ch}^2 \frac{x}{a} = \frac{y^2}{a}$$

formula bo‘yicha hisoblanadi.

- zanjirli chiziq, uning ikkita ordinatalari va abssissalar o‘qi bilan chegaralangan sohaning

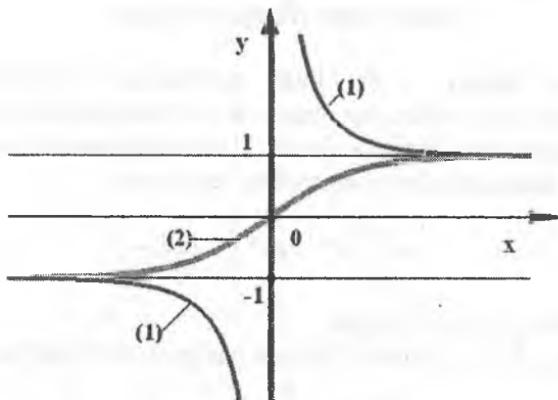

$$S = a^2 \left( \operatorname{sh} \frac{x_1}{a} - \operatorname{sh} \frac{x_2}{a} \right) = a \left( \sqrt{y_2^2 - a^2} - \sqrt{y_1^2 - a^2} \right)$$

formula bo‘yicha hisoblanadi.

17-chizma. (1) –  $y = chx = \frac{e^x + e^{-x}}{2}$ , (2) –  $y = shx = \frac{e^x - e^{-x}}{2}$ .

## 12. Giperbolik tangens va giperbolik kotangens funksiyalar

18-chizma. (1) –  $y = \operatorname{cthx} = \frac{e^x + e^{-x}}{e^x - e^{-x}}$ , (2) –  $y = \operatorname{thx} = \frac{e^x - e^{-x}}{e^x + e^{-x}}$ .

## 13. Dekart yaprog'i

**Tarixiy ma'lumotlar.** Qaralayotgan chiziq matematika tarixida birinchi marta R. Dekartning Fermaga 1638 yilda yuborgan xatida uchraydi. Chiziqning shakli haqida birinchi tadqiqot Roberval tomonidan amalga oshirilgan. Lekin u chiziqni faqat sirtmoqdan iborat, deb tushungan. Sirtmoqni to'rtta kvadratda takrorlab, Roberval to'rt yaproqli gulni eslatuvchi shaklga ega bo'lgan. Shuning uchun chiziqqa «yaprog'i» nomi berilgan. Lekin chiziqning to'la shakli keyinroq X.Guyugens va I.Bernulli tomonidan aniqlangan. «Dekart yaprog'i» nomi faqat XVIII asrning boshidan boshlab qo'llanila boshlandi.

Dekart yaprog'i – uchinchi tartibli tekis egri chiziqdan iborat va u to'g'ri burchakli koordinatalar sistemasida  $x^3 + y^3 = 3axy$  tenglamani qanoatlantiradi. 3a parametr – tomoni sirtmoqning eng katta vatariga teng bo'lgan kvadratning diagonali kabi aniqlanadi.

Uning tenglamalari :

1) to'g'ri burchakli koordinatalar sistemasida:  $x^3 + y^3 = 3axy$  ;

2) qutb koordinatalar sistemasida:  $\rho = \frac{3a \cos \varphi \sin \varphi}{\cos^3 \varphi + \sin^3 \varphi}$  ;

3) parametrik ko'rinishda

$$\begin{cases} x = \frac{3at}{1+t^3}, \\ y = \frac{3at^2}{1+t^3}, t = \operatorname{tg} \varphi \end{cases}$$

kabi ifodalanadi.

Ko'pincha  $135^\circ$  ga burilgan egra chiziq qaraladi. Uning tenglamalari quyidagicha bo'ladi :

- to'g'ri burchakli sistemada

$$y = \pm x \sqrt{\frac{l+x}{l-3x}}, l = \frac{3a}{\sqrt{2}};$$

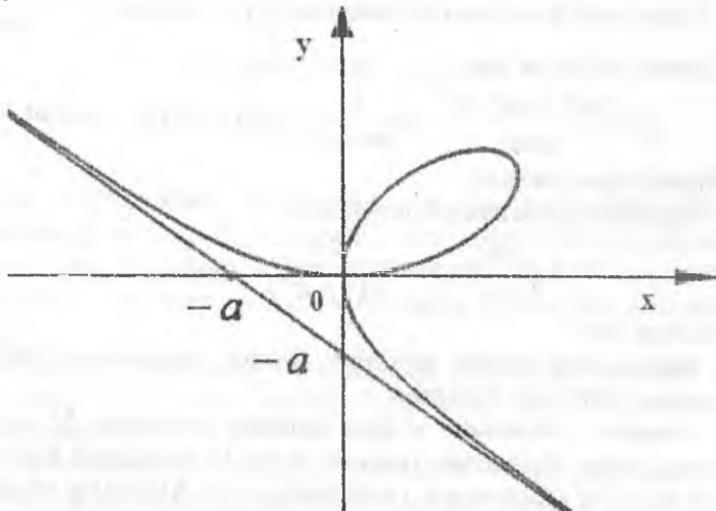

- qutb koordinatalari sistemasida

$$\rho = \frac{l(\sin^2 \varphi - \cos^2 \varphi)}{\cos \varphi (\cos^2 \varphi + 3\sin^2 \varphi)};$$

- parametrik shaklda

$$x = l \frac{t^2 - 1}{3t^2 + 1}; y = l \frac{t(t^2 - 1)}{3t^2 + 1}$$

Dekart yaprog'i – yasmin guli deb ham atalgan (inglizcha jasmine flower).

19-chizma. Dekart yaprog'i.

## 14. Diokl sissoidasi

**Tarixiy ma'lumotlar.** Sissoida qadimgi olimlar tomonidan (eramizgacha bo'lgan V-asr) o'sha zamondagi mashhur masalalardan birini yechish jarayonida ochilgan. Bunday masalalar quyidagilardan iborat: doiraning kvadraturasi (izi berilgagn doiraning yuziga teng bo'lgan kvadrat yasash) masalasi, burchakning triseksiyasi (berilgan burchakni teng uchga bo'lish) masalasi, kubni ikkilantirish (hajmi berilgan kub hajmidan ikki marta katta bo'lgan kub yasash) masalasi. Bu qo'yilgan masalalarni sirkul va chizg'ich yordamida yechish talab qilingan.

Kubni ikkilantirish masalasini yechish maqsadida sisstondaning nashr qilinishi eramizdan oldingi II asrda ijod qilgan qadimgi dunyo yunon geometri Diokles nomi bilan bog'liq. Shu sababdan chiziq Diokles sissoidasi deb ham yuritiladi.

Diokl sissoidasi – uchinchi tartibli tekis algebraik egri chiziqdan iborat.

Sissoidaning to'g'ri burchakli koordinatalar sistemasidagi tenglamasi quyidagicha yoziladi :  $y^2 = \frac{x^3}{2a - x}$ .

Uning qutb koordinatalar sistemasidagi tenglamasi  $\rho = \frac{2a \sin^2 \varphi}{\cos \varphi}$  ko'rinishda bo'lib, ba'zan

$$\rho = \frac{2a(1 - \cos^2 \varphi)}{\cos \varphi} = 2a\left(\frac{1}{\cos \varphi} - \cos \varphi\right) = 2a(\sin \varphi - \cos \varphi)$$

ko'rinishda ham yoziladi.

Sissoidaning parametrik tenglamasi

$$x = \frac{2a}{1 + u^2}, y = \frac{2au}{u(1 + u^2)}, \text{ bunda } u = \operatorname{tg} \varphi$$

ko'rinishga ega.

Sissoidaning hozirgi ko'rinishi fransuz matematiga J.Robervaya tomonidan 1650 yilda berilgan.

Sissoida – absissalar o'qiga nisbatan simmetrik. U yordamchi aylanani, uning diametrida yotuvchi B va D nuqtalarda kesib o'tadi, hamda bitta UV (chizmaga q.) asimptotaga ega. Asimptot tengdamasi :  $x = 2a$ ,  $a$  – yordamchi aylananiq radiusi.

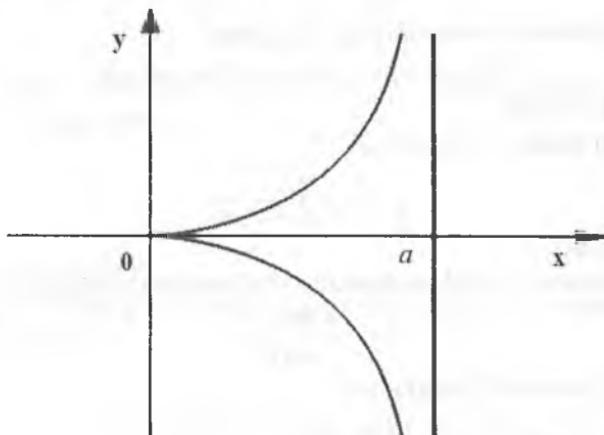

Sissoida va uning asimptotasi orasidagi yuza

$$S_1 = 3\pi a^2$$

Sissoida OL tarmog‘ining (18-chizmaga q.) absissalar o‘qi atrofida aylanishidan hosil bo‘lgan jismning  $V_1$  hajmi quyidagicha hisoblanadi :

$$V_1 = \pi \int_0^{2a} \frac{x^3}{2a-x} dx = \pi \int_0^{2a} \left( -x^2 - 2ax - 4a^2 + \frac{8a^2}{2a-x} \right) dx = -\frac{44\pi a^3}{3} - 8\pi a^3 (\ln(2a-x)) \Big|_0^{2a}$$

$x \rightarrow 2a$  da  $\ln(2a-x) \rightarrow -\infty$ , y’ani  $V_1 \rightarrow \infty$ .

20-chizma. Diokl sissoidasi.

## 15. Strofonda

**Tarixiy ma'lumotlar.** Strofondagi birinchi marta 1645 yilda italiya matematigi va fizigi E. Torrichelli (1608-1647 yy) taddiq qilgan. Chiziq uzoq vaqt davomida «Torrichelli qanoti» degan nom bilan yuritilgan «Strofonda» atamasi faqat XIX asrning o‘rtalaridan qo‘llanila boshlandi.

E. Torrichelli Faensda tug‘ilib matematik ta’limini Rimda oldi. E. Torrichelli atoqli fizik olim bo‘lishi bilan birga ajoyib matematik kashfiyotlar muallifidir.

U ko‘p jismlarning hajmlarini (jumladan, cheksiz jismlarning ham), egri chiziqlar bilan chegaralangan shakllar yuzlarini hisoblash, chiziqlar yoylari uzunliklarini topish usullari mualifidir.

Strofoda ko‘p sonli geometrik tadbiqlardan tashqari, optika va chizma geometriyaning ba’zi masalalarida ham uchraydi.

Strofoida (yunonchadan - burilish) – uchinchi tartibli algebraik egrichiziq.

To‘g‘ri burchakli koordinatalar sistemasida to‘g‘ri strofoida, yoki strofoida quriladi (yasaladi) (21-chizma).

Qiyshiq burchakli koordinatalar sistemasida qiyshiq strofoida yasaladi (2-chizma).

O – koordinatalar boshi, absissalar o‘qi – OV nur bo‘ylab, ordinatalar o‘qi – OD nur bo‘ylab yo‘nalganda va  $\alpha = \angle AOD$  (to‘g‘ri burchakli koordinatalar sistemasi uchun  $\alpha = \frac{\pi}{2}$ ) bo‘lganda, strofoidaning Dekart koordinatalar sistemasidagi tenglamasi

$$y^2(x-a) - 2x^2y \cos \alpha + x^2(a+x) = 0$$

ko‘rinishida yoziladi.

To‘g‘ri strofoida tenglamasi

$$y = \pm x \sqrt{\frac{a+x}{a-x}}$$

ko‘rinishni oladi.

Strofoidaning qutb koordinatalar sistemasidagi tenglamasi

$$\rho = -\frac{a \cos 2\varphi}{\cos \varphi};$$

Uning parametrik tenglamasi

$$x = a \left( \frac{u^2 - 1}{u^2 + 1} \right), \quad y = au \left( \frac{u^2 - 1}{u^2 + 1} \right), \quad u = \operatorname{tg} \varphi$$

ko‘rinishga ega.

Strofoida dastlab fransuz matematigi Jil Roberval tomonidan 1645 yilda qaralgan. Roberval bu egrini chiziqni “Pteroida” – qanon deb atagan. Strofoida nomi fanga birinchi marta 1849 yilda kiritilgan.

Strofoidaning to‘g‘ri urinmasini topish quyidagicha amalgashiriladi. To‘g‘ri strofoidaning Dekart koordinatalar sistemasidagi tenglamasidan

$$y' = \sqrt{\frac{a+x}{a-x} \left( 1 + \frac{ax}{a^2 - x^2} \right)}$$

ekanligini topamiz va bu hosilaning O(0,0) nuqtalarida qiymatlarini hisoblasak,  $y' = \pm 1$  ekanligini, ya’ni O(0,0) ikkita perpendikulyar urinmalar mavjudligini ko‘ramiz, urinmalarning og‘ish burchagi  $\pm \frac{\pi}{4}$  ga tengligini olamiz.

Strofoidaning egrilik radiusi, ya'ni  $R=ON$  ning  $O(0,0)$  nuqtadagi qiymati

$$R = \frac{a}{\cos \angle AON} = \frac{a}{\cos \frac{\pi}{4}} = a\sqrt{2}$$

bo'ladi.

To'g'ri strofoida sirtmog'ining ordinatalar o'qidan chapdag'i yuzi

$$S_1 = a^2 \left( 2 - \frac{\pi}{2} \right)$$

formula orqali, strofoida va ordinatalar o'qidan o'ngda yotuvchi asimtota orasidagi yuza

$$S_1 = a^2 \left( 2 + \frac{\pi}{2} \right)$$

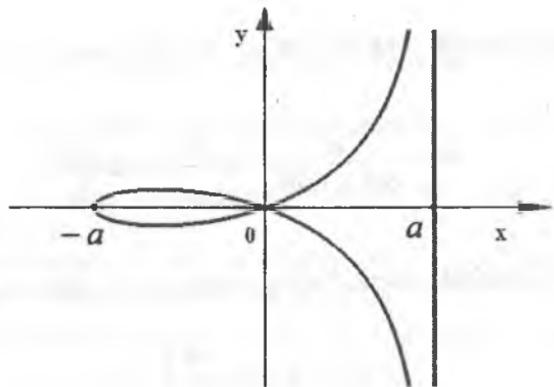

formula orqali topiladi.

$OM_1A$  yoning abssissalar o'qi atrofida aylanishidan hosil bo'lgan jismning  $V_1$  hajmi,

$$\begin{aligned} V_1 &= \pi \int_{-a}^0 \left( x \sqrt{\frac{a+x}{a-x}} \right)^2 dx = \pi \int_{-a}^0 x^2 \frac{a+x}{a-x} dx = \\ &= -\pi \int_{-a}^0 x^2 dx - 2\pi a \int_{-a}^0 x dx - 2\pi a^2 \int_{-a}^0 dx + 2\pi a^3 \int_{-a}^0 \frac{dx}{a-x} = \\ &= -\frac{a^3 \pi}{3} + a^3 \pi - 2a^3 \pi + 2a^3 \pi \ln 2 \end{aligned}$$

Demak,

$$V_1 = a^3 \pi \left( 2 \ln 2 - \frac{4}{3} \right)$$

21-chizma. Strofoida.

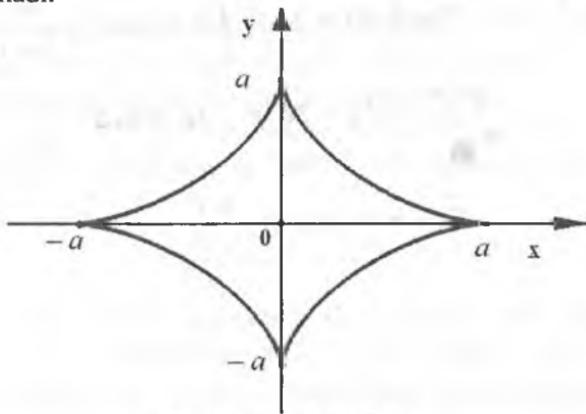

### 16.Astroida

Astroidaning tenglamalari (22-chizma):

- 1) to‘g‘ri burchakli koordinatalar sistemasida:  $x^{\frac{3}{2}} + y^{\frac{3}{2}} = a^{\frac{3}{2}}$ ,  
 $(x^2 + y^2 - a^2)^3 + 27a^2x^2y^2 = 0$ ;

- 2) parametrik ko‘rinishda  $\begin{cases} x = a \cos^3 t, \\ y = a \sin^3 t \end{cases}$

kabi ifodalanadi.

22-chizma. Astroida.

## 17. Sikloida

**Tarixiy ma'lumotlar.** Atoqli italiya olimi Galillo Galiyey (1564-1642yy) birinchi bo'lib, fanga «sikloida» (yoki «doirani eslatuvchi») atamasini kiritgan.

Galiley sikloidaning bitta ravog'i va uning asosi blilan chegaralangan shaklning yuzi, uni yasovchi doira yuzidan uch marta katta ekanligi ko'rsatgan.

XVII asrning 30- yillardan boshlab sikloida eng ommaviy chiziqlardan biriga aylanadi, ko'p matematiklar bu chiziqdagi o'zlarining yangi usullari kuchini sinab ko'rishgan. Galiley teoremasining ajoyib isboti Roberval (1634 y) tomonidan va unga bog'liq bo'lmagan holda (va o'zları bilmagan holda) Ferma va Dekart (1638y) tomonidan berilgan. Ular sikloidaga urinma yasash usullarini ham ko'rsatishgan. B. Paskal tomonidan siklaidaning aylanishidan hosil bo'lган jismning hajmi va sirtqi hisoblangan hamda ularning og'irlik markazlari topilgan. Siklaodaning to'g'irlanuvchanligi (ya'ni uning yoyi uzunligini topish) Ren (1658y) tomonidan amalga oshirilgan.

Sikloidani tekshirish bilan boshqa olimlar ham shug'ullanishgan. X. Gyuygens va I. Bergulli uning muhim mexanik hissalarini aniqlashgan.

Sikloida (yunon tilida "yumaloq") – tekis **transsendent** egri chiziqdan iborat. U, kinematik tarzda,  $r$  radiusli "hosil qiluvchi", sirpanmasdan to'g'ri chiziq bo'ylab dumalaydigan, aylananing belgilangan nuqtasining trayektoriyasi sifatida aniqlanadi (23-chizmaga qarang).

Uning tenglamalarini keltirib chiqarish uchun, koordinatalar sistemasining gorizontal o'qini  $r$  radiusli "hosil qiluvchi" aylana aylanadigan to'g'ri chiziq, deb qabul qilamiz.

- Sikloidaning parametrik tenglamasi :

$$\begin{cases} x = rt - r \sin t, \\ y = r - r \cos t \end{cases}$$

- Dekart koordinatalar sistemasidagi tenglamasi :

$$x = r \arccos \frac{r-y}{r} - \sqrt{2ry - y^2}$$

- Sikloida quyidagi

$$\left( \frac{dy}{dx} \right)^2 = \frac{2r-y}{y}$$

ko'rinishidagi oddiy differensial tenglamaning yechimi kabi olinishi ham mumkin.

Sikloida quyidagi xossalarga ega :

1. Sikloida – abussissalar o‘qi bo‘ylab davriy funksiya va uning davri  $2\pi r$  ga teng.

2. Sikloidaga uning ixtiyoriy A nuqtasida urinma o‘tkazish uchun, shu nuqtani “hosil qiluvchi” aylananing yuqori nuqtasi bilan tutashtirish yetarli. A nuqtani “hosil qiluvchi” aylananing quyi nuqtasi bilan tutashtirganda biz normalga ega bo‘lamiz.

3. Sikloida arkining uzunligi  $8r$  ga teng. Bu xossa 1658 yilda Kristofer Rek tomonidan ochilgan.

4. Sikloidaning har bitti arki tagidagi yuza, “hosil qiluvchi” doira yuzidan uch marta katta. Torichellining fikricha, bu xossa Galiley tomonidan ochilgan.

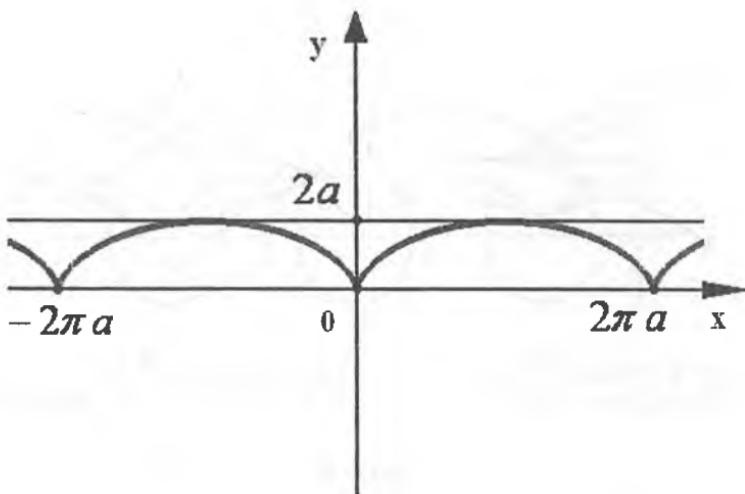

5. Sikloida birinchi arkining egrilik radiusi  $4r \sin \frac{t}{2}$  ga teng.

6.“To‘nkarilgan” sikloida – eng tez tushish egri chizig‘i (braxistoxrona)dan iborat.

7. Sikloidaning evolyutasi, berilgan sikloidaga kongruent, sikloidadan iborat.

Olimlar ichida, sikloidaga e’tiborni, birinchi bo‘lib, XV asrda Nikolay Kuzanskiy qaratgan, lekin bu egri chiziqlari tadqiq qilish, asosan, XVII asrda boshlangan. Sikloida nomini Galiley o‘ylab topgan (Fransiyada bu egri chiziqlari, dastlab, ruletta deb atagan). Sikloidani batafsil tadqiq qilish Galileyning zamondoshi Mersenn tomonidan amalga oshirilgan. U – transsident egri chiziqlari, ya’ni tenglamasi x,u larga nisbatan ko‘phad shaklida ifodalanmaydigan egri chiziqlari, ichida birinchi tadqiq etilganidir.

Sikloidani tadqiq qilishda , XVII – XVIII asrlarda ijod qilgan buyuk fan darg‘alari Dekart, Ferma, Nyuton, Leybnis hamda aka-uka Bernullililar ham ishtiroy etishgan.

23-chizma. Sikloida.

### 18. Giposikloida

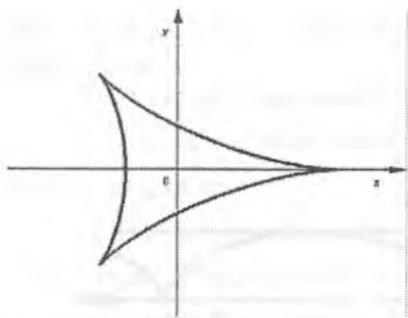

Giposikloida (yunonchadan doiraning, aylananing tagi, pasti) – aylananing nuqtasi, boshqa bir aylananing ichki tomonida sirpanmasdan dumalaganda hosil qilinadigan tekis egri chiziqdan iborat (24 - chizma).

Uning parametrik tenglamasi

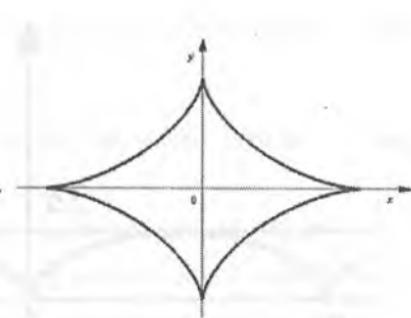

$$\begin{cases} x = r(k-1) \left( \cos t + \frac{\cos(k-1)t}{k-1} \right), \\ y = r(k-1) \left( \sin t - \frac{\sin(k-1)t}{k-1} \right) \end{cases}$$

ko‘rinishga ega, bunda  $k = \frac{R}{r}$ , R – qo‘zg‘almas aylananing radiusi, r – aylanayotgan aylananing radiusi.

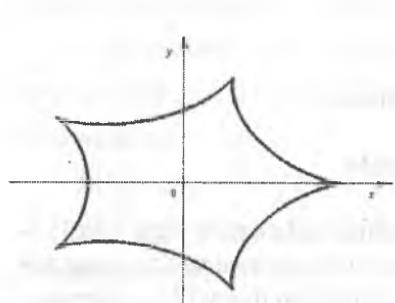

$k$  miqdorning moduli giposikloidaning shaklini aniqlaydi.  $k=2$  bo‘lganda giposikloida qo‘zg‘almas aylananing diametridan iborat,  $k=4$  bo‘lganda esa, u astroidaga aylanadi.  $k$  ning har xil qiymatlariga mos kelgan giposikloidalar 2-chizmada keltirilgan.

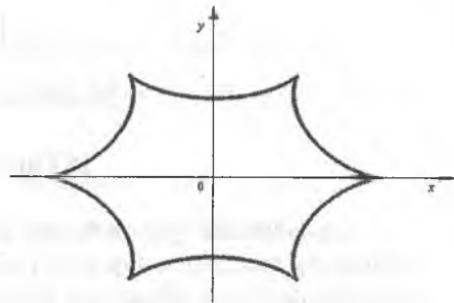

$$1) r = 1, R = 3, k = \frac{R}{r} = 3.$$

$$2) r = 1, R = 4, k = \frac{R}{r} = 4.$$

$$3) r = 1, R = 5, k = \frac{R}{r} = 5.$$

$$4) r = 1, R = 6, k = \frac{R}{r} = 6.$$

24-chizma. Giposikloida

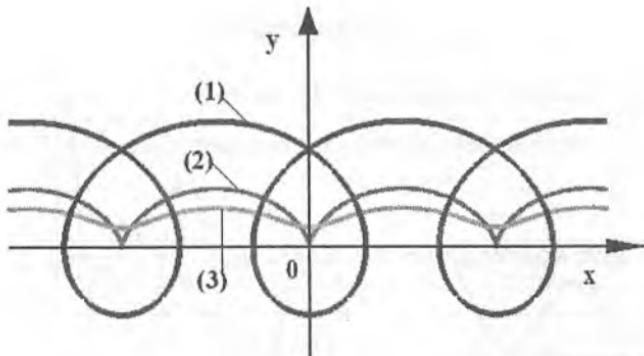

### 19. Troxoida

Troxoida – quyidagi

$$\begin{cases} x = at - \lambda \sin t \\ y = a - \lambda \cos t \end{cases}$$

parametrik tenglamalar orqali berilgan tekis transsendensi chiziqdandan iborat.

$a = \lambda$  bo‘lganda troxoida sikloidaga o‘tadi.  $\lambda > a$  bo‘lganda troxoida uzaytirilgan sikloida deb,  $\lambda < a$  bo‘lganda esa, qisqartirilgan sikloida deb ataladi.

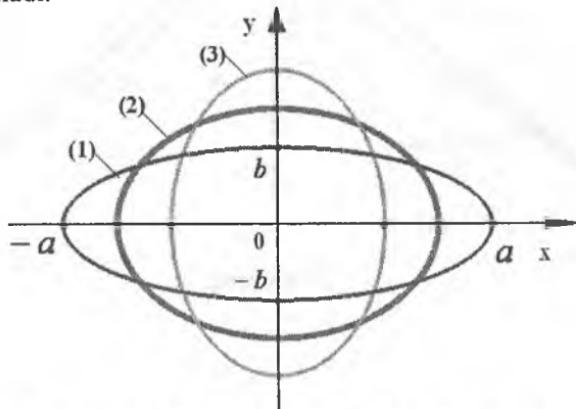

25-chizma. (1)-  $a = 2$ ,  $\lambda = 5$ , (2)-  $a = 2$ ,  $\lambda = 2$ , (3)-  $a = 2$ ,  $\lambda = 0,5$ .

## 20. Ellips

Ellipsning tenglamalari (26-chizma):

- 1) to‘g‘ri burchakli koordinatalar sistemasida:  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$  ;
- 2) qutb koordinatalar sistemasida:  $\rho = \frac{b^2}{a - c \cos \varphi}$  ;
- 3) parametrik ko‘rinishda:  $\begin{cases} x = a \cos t \\ y = b \sin t \end{cases}$

kabi ifodalanadi.

26-chizma. (1)-  $a > b$ , (2)-  $a = b$ , (3)-  $a < b$ .

## 21. Giperbola

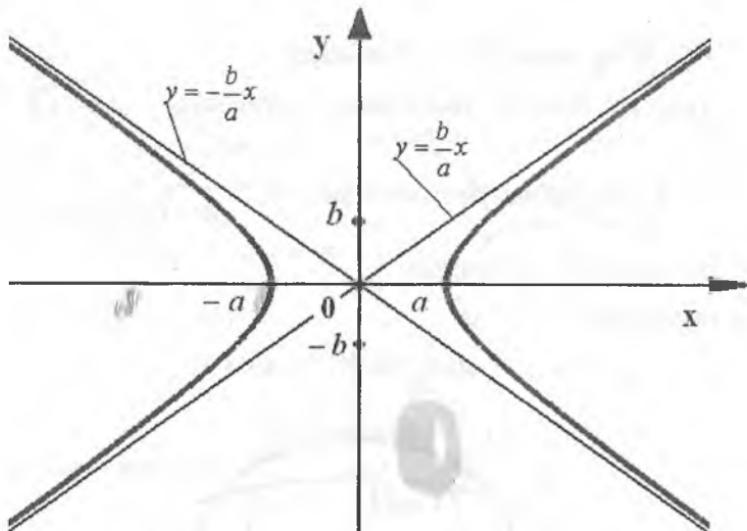

Giperbolaning tenglamalari (27-chizma):

1) to‘g‘ri burchakli koordinatalar sistemasida  $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$  ;

2) qutb koordinatalar sistemasida  $\rho = \frac{b^2}{a - c \cos \varphi}$  ;

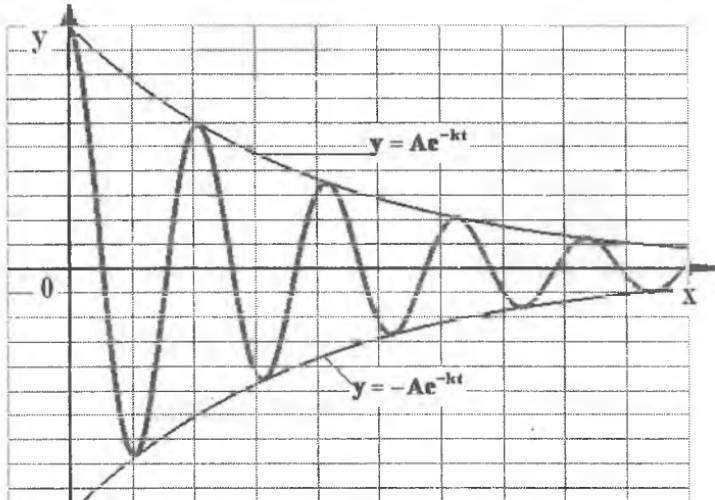

3) parametrik ko‘rinishda  $\begin{cases} x = a \cdot t \\ y = b \cdot \ln t \end{cases}$

kabi ifodalanadi.

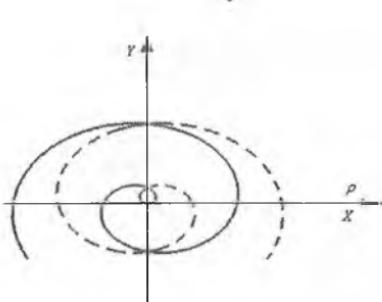

27-chizma.

## 22. Garmonik tebranish

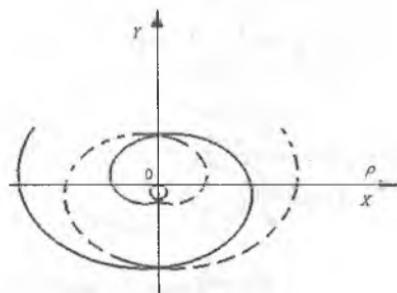

$$28\text{-chizma. } y = Ae^{-kt} \sin(wt + \alpha)$$

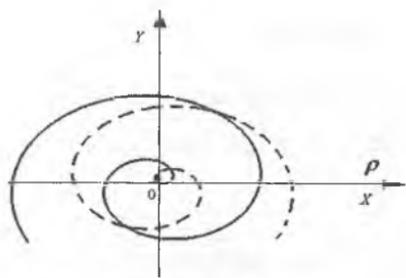

## 23. Arximed spirallari.

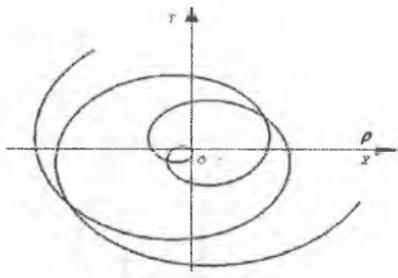

1)  $\rho = a \varphi$  ( $a > 0$ ).

2)  $\rho = a \varphi$  ( $a < 0$ ).

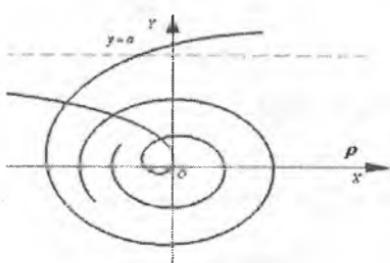

3)  $\rho = a\varphi + l$  ( $a > 0, l > 0$ ).

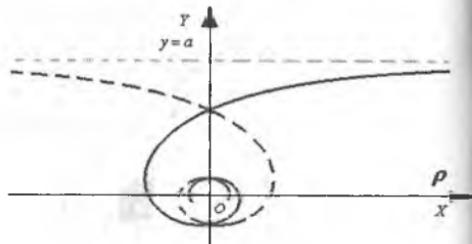

4)  $\rho = a\varphi + l$  ( $a > 0, l < 0$ ).

29- chizma. Arximed spirallari.

## 24. Giperbolik spirallar

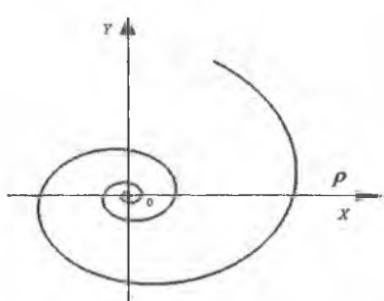

1)  $\rho = \frac{a}{\varphi}$  ( $a > 0$ ).

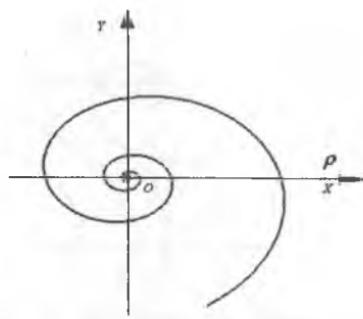

1)  $\rho = \frac{a}{\varphi} + l$  ( $a > 0, l > 0$ ).

30- chizma. Giperbolik spirallar- 1), 2).

## 25. Logarifmik spiralleri

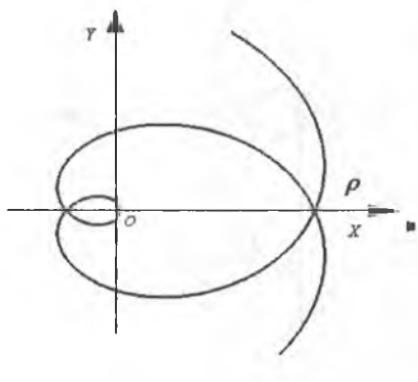

$$1) \rho = b^{a\varphi} \quad (b > 0, a > 0).$$

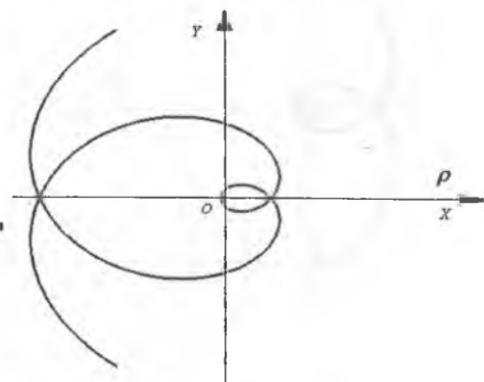

$$2) \rho = b^{a\varphi} \quad (b > 0, a < 0).$$

31- chizma. Logarifmik spiralleri- 1), 2).

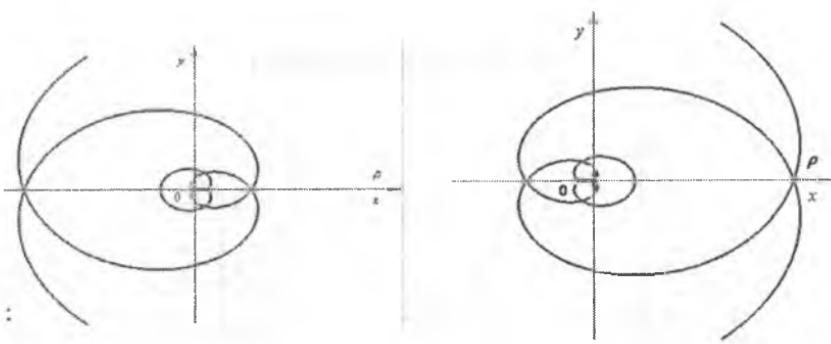

## 26. Galiley spiralleri

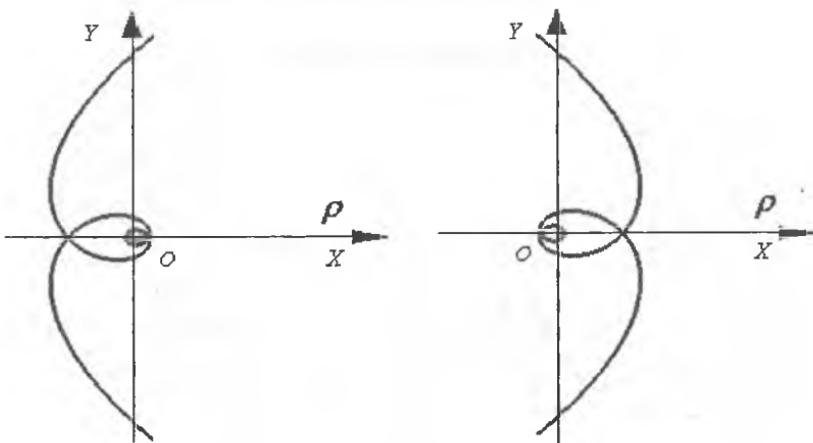

$$1) \rho = a \varphi^2 \quad (a > 0).$$

$$2) \rho = a \varphi^2 \quad (a < 0).$$

3)  $\rho = a \varphi^2 - l$  ( $a = 0,2 > 0, l = 3 > 0$ ). 4)  $\rho = a \varphi^2 - l$  ( $a = -0,2 < 0, l = -3 < 0$ ).

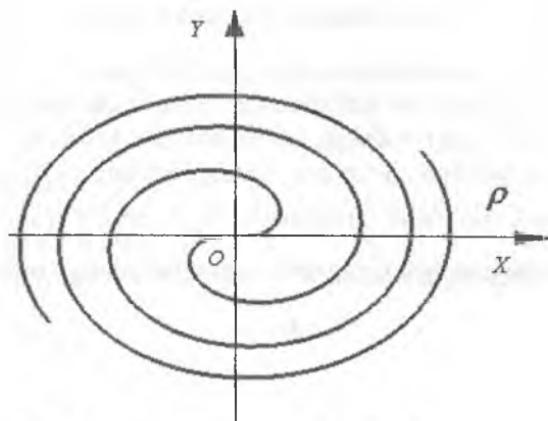

5)  $\rho = \frac{a}{\varphi^2}$  ( $a > 0$ ).

6)  $\rho = \frac{a}{\varphi^2}$  ( $a < 0$ ).

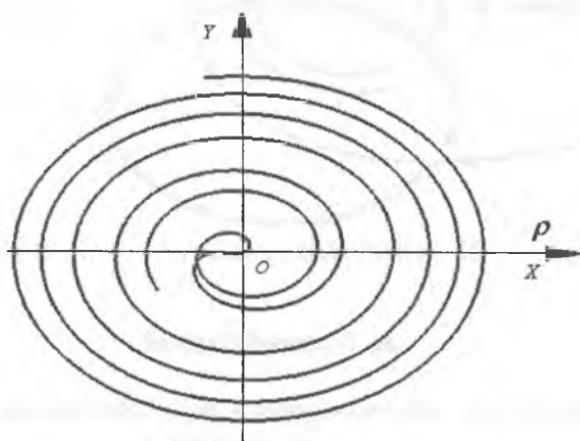

32- chizma. Galiley spirallari- 1), 2), 3), 4) 5) 6).

## 27. Ferma spirali

33- chizma. Ferma spirali.  $\rho^2 = a^2\varphi$ .

## 28. Parabolik spirali

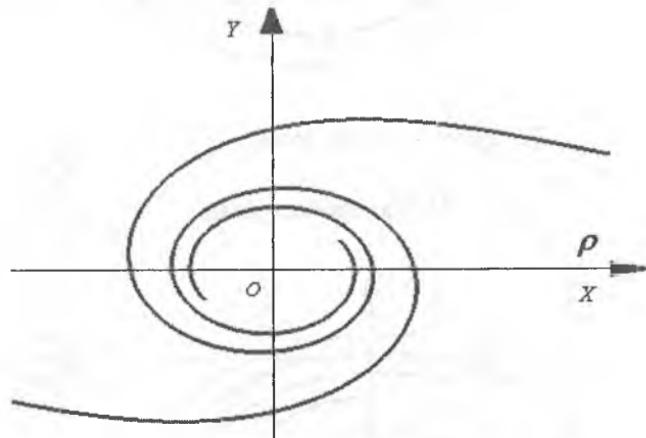

34- chizma. Parabolik spirali.  $(\rho - l)^2 = a^2\varphi$  ( $l > 0$ )

## 29. Jezl spirali

Jezl – qutb koordinatalar sistemasida ushbu  $\rho = \frac{a}{\sqrt{\varphi}}$  tenglama bilan ifodalanadigan tekis transsendent egri chiziqdir.

Egri chiziq cheksizlikdan (u yerda u gorizontal o‘qqa asimtotik yaqinlashadi) (0,0) nuqtaga, uning atrofida spiral bo‘yicha soat miliga teskari yo‘nalishda aylangan holda, intiladi. Spiralning kattaligi  $a$  koeffisiyent bo‘yicha aniqlanadi. Egri chiziq fazasi bitta,  $\left(\frac{1}{2}, a\sqrt{2}\right)$  egilish nuqtasiga ega. U algebraik spirallar oilasiga mansub.

35- chizma. Jezl spirali.  $\rho^2 = \frac{a^2}{\varphi} (a > 0)$ .

## 30. Sinusoidal spiral

Geometriyada , sinusoidal spiral - qutb koordinatalar sistemasida  $r^n = a^n \cos(n\Theta)$

tenglama orqali aniqlanadigan egri chiziqlar oilasidan iborat, bunda  $a$  – noldan farqli o‘zgarmas son va  $n$  – nolga teng bo‘lmagan rasional son.

Agar egri chiziqni koordinatalar boshiga nisbatan burish imkoniyati hisobga olinsa, uning tenglamasi

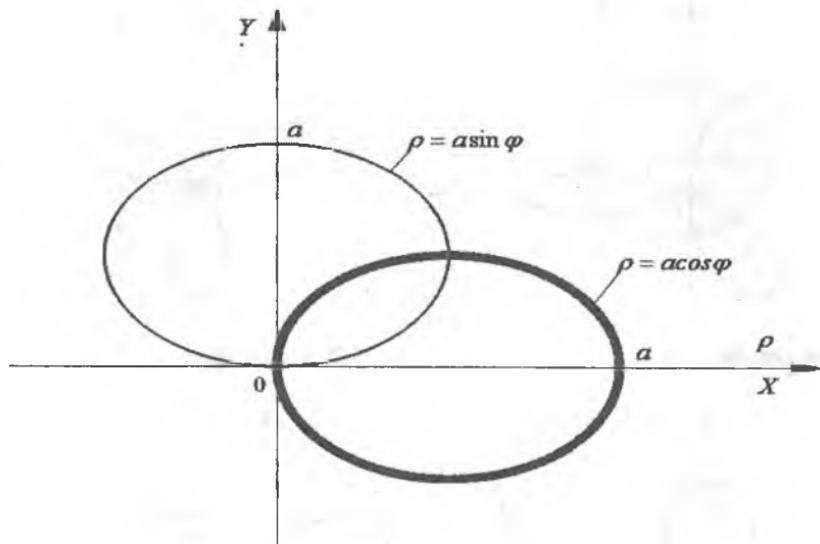

$$r^n = a^n \sin(n\Theta)$$

ko‘rinishda yozilishi ham mumkin.

Ko‘p ma’lum egri chiziqlar sinusoidal spiralning xususiy hollaridan iborat :

- to‘g‘ri chiziq ( $n = -1$ ) ;
- aylana ( $n = 1$ ) ;
- giperbola ( $n = -2$ ) ;
- parabola ( $n = -\frac{1}{2}$ ) ;
- kardioida ( $n = \frac{1}{2}$ ) ;
- Bernulli lemniskatasi ( $n = 2$ ).

Sinusoidal spiral birinchi marta Makloren tomonidan o‘rganilgan.

36- chizma.  $\rho = a \sin \varphi$ ,  $\rho = a \cos \varphi$ ,  $a = 2$ .

### 31. Atirgul

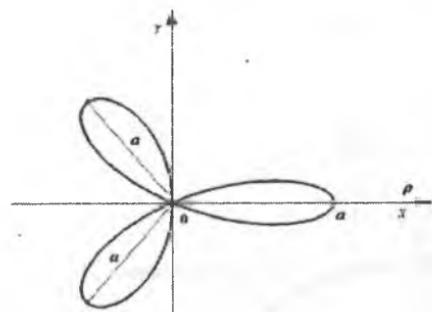

Gulning simvolik tasvirini eslatuvchi tekis egri chiziq – atirguldir. Uning qutb koordinitalar sistemasidagi tenglamasi

$$\rho = a \sin k\varphi$$

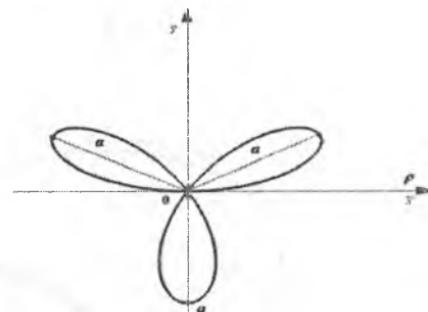

Ko‘rinishga ega. Bu yerda  $a$  va  $k$  lar, berilgan atirgulning o‘lchami ( $a$ ) va uning yaproqlari soni ( $k$ ) ni ifodalovchi o‘zgarmas sonlar.

Egri chiziq to'lasincha  $a$  radiusli aylana ichida joylashadi va  $k > 1$  bo'lganda bir xil shakl va o'lchamlardagi yaproqlardan tashkil topadi. Yaproqlarning soni, bu holda,  $k$  miqdor orqali aniqlanadi.

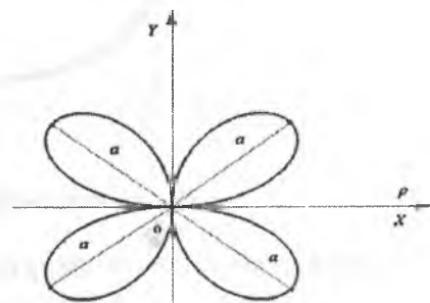

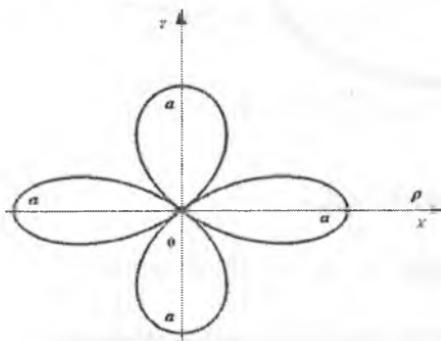

$k$  butun son bo'lganda, yaproqlar soni agar  $k -$  toq bo'lsa,  $k$  ga teng bo'lib, agar  $k$  juft bo'lsa,  $2k$  ga teng bo'ladi.  $k$  son o'zaro tub bo'lgan  $m$  va  $n$  sonlarning nisbatidan iborat, ya'ni  $k = \frac{m}{n}$  bo'lsa,  $m$  va  $n$  lar toq bo'lganda, atirgulning yaproqlari soni  $m$  ga, ulardan hyech bo'limganda bittasi juft bo'lganda esa, yaproqlar soni  $2m$  ga teng bo'ladi.  $k$  - irrasional son bo'lsa, yaproqlar soni cheksiz ko'p bo'ladi.

$$1) \rho = a \cos 3\varphi .$$

$$2) \rho = a \sin 3\varphi .$$

37- chizma. Uch yaproqli atirgulil

$$1) \rho = a \cos 2\varphi$$

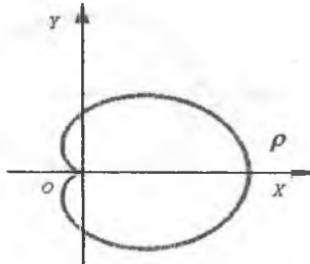

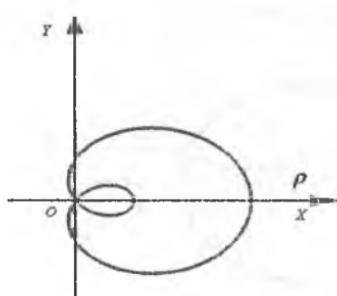

$$2) \rho = a \sin 2\varphi$$

38- chizma. To'rt yaproqli atirgular.

### 32. Paskal chig'anog'i

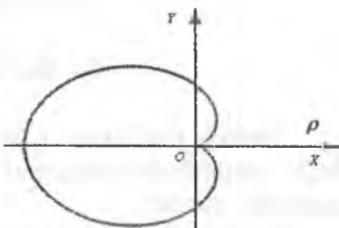

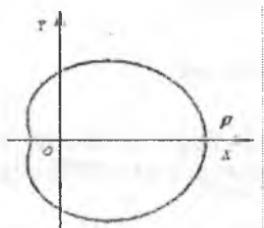

**Tarixiy ma'lumotlar.** Qaralayotgan chiziq mashhur fransuz olimi B. Paskalning (1623-1663 yy)otasi, ko'p yillar soliq tizimida faoliyat ko'rsatgan, lekin 1666 yilda Parij akademiyasiga aylantirilgan matematiklar va fiziklar kurojogining faol ishtirokchisi, E. Paskal (1588-1651 yy) sharafiga shu nom bilan ataladi. E. Paskal matematik qiziqishlari egri chiziqlar haqidagi ta'minot bilan bevosita bog'liq.

Paskal chig'anog'i texnikada keng qo'llaniladi. Semaforni ko'tarish va tushirish mexaniyasini tashkil etuvchi qismlardan buni Paskal chig'anog'i bo'yicha yasalgan.

$$1) 2a > l$$

$$2) 2a = l$$

$$3) 2a < l$$

$$4) \rho = 2a(1 - \cos\varphi), 2a > 0.$$

39- chizma. Paskal chig'anog'i.  $\rho = 2a \cos\varphi + l$ , 1), 2), 3), 4).

### 33. Kardioida

Kardiodaning tenglamalari (39-chizma):

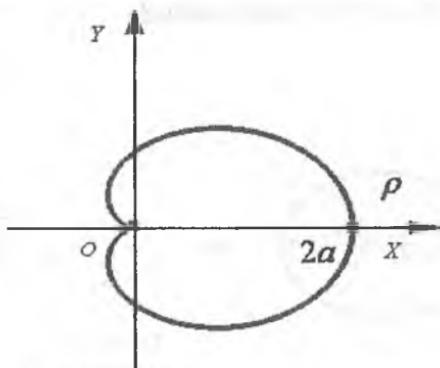

1) to‘g‘ri burchakli koordinatalar sistemasida

$$(x^2 + y^2)(x^2 + y^2 - 2ax) - a^2 x^2 = 0;$$

2) qutb koordinatalar sistemasida  $\rho = 2a(1 + \cos\varphi)$ ;

3) parametrik ko‘rinishda  $\begin{cases} x = a \cos t (1 + \cos t), \\ y = a \sin t (1 + \cos t). \end{cases}$

kabi ifodalanadi.

40- chizma. Kardioida.

### 34. Beriulli lemniskatasi

**Tarixiy ma’lumot.** Chiziq uni tahlil qilgan olimning nomi bilan ataladi. Lemniskata tenglamasi birinchi marta Ya.Beriullining (1694y) maqolasida uchradi.

Ya.Beriulli (1654-1705) Shveysiyalik matematik, cheksiz kichik miqdorlar analizi bo‘yicha mashhur olim. Ya. Beriulli lemniskata, lagariflim spiral, zajir chiziq va hokazo chiziqlar xossalari yangi g‘oyalar qo‘lladi. U matematikaning yangi sohasi variasion hisobiga asos soldi.

Beriulli lemniskatasi qiziq xossalarga ega va keng qo‘llaniladi. Lemniskatadan texnikada, xususan, tog‘li hududlardagi temir yo‘l shahobchalarini, tramvay yo‘llardagi kichik radiusli aylanish joylarda o‘tish chizig‘i sifatida foydalilanildi.

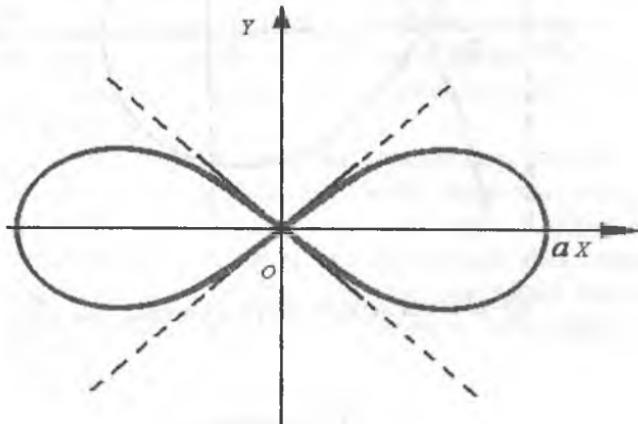

Kardiodaning tenglamalari (40-chizma):

1) to‘g‘ri burchakli koordinatalar sistemasida  $(x^2 + y^2)^2 - a^2(x^2 - y^2) = 0$ ;

2) qutb koordinatalar sistemasida  $\rho^2 = a^2 \cos 2\varphi$ ;

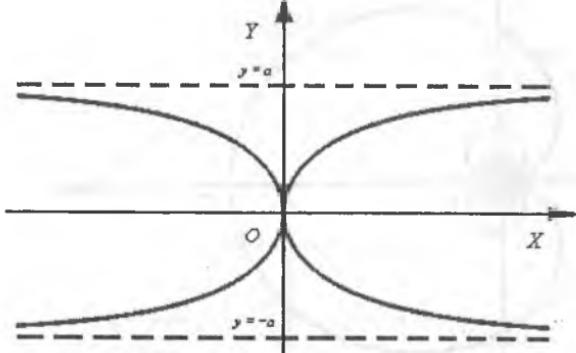

3) parametrik ko‘rinishda  $\begin{cases} x = a\sqrt{2} \frac{\rho + \rho^3}{1 + \rho^4}, \\ y = a\sqrt{2} \frac{\rho - \rho^3}{1 + \rho^4}, \end{cases}$  bunda  $\rho^2 = \operatorname{tg}\left(\frac{\rho}{4} - \varphi\right)$

kabi ifodalanadi.

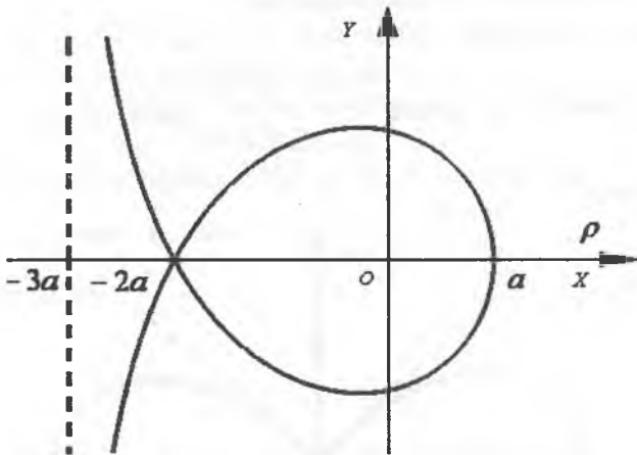

41- chizma. Bernulli lemniskatasi.

### 35. Kappa

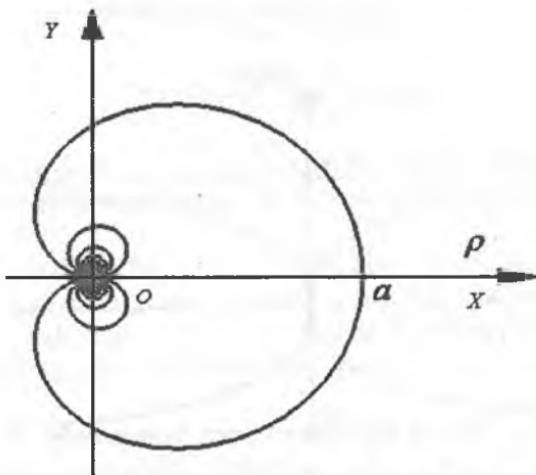

42- chizma. Kappa.  $(x^2 + y^2)y^2 - a^2x^2 = 0$ ,  $\rho = a \operatorname{ctg} \varphi$ .

### 36. Makloren trisektrisasi

43- chizma. Makloren trisektrisasi.  $\rho = \frac{a}{\cos \frac{\varphi}{3}}$ .

### 37. Koxleoida

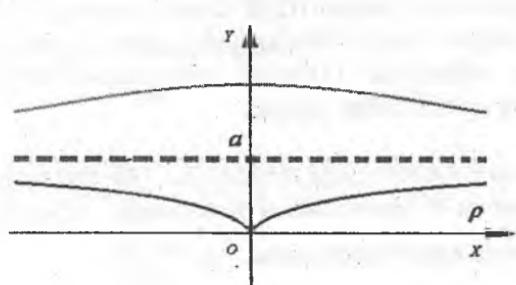

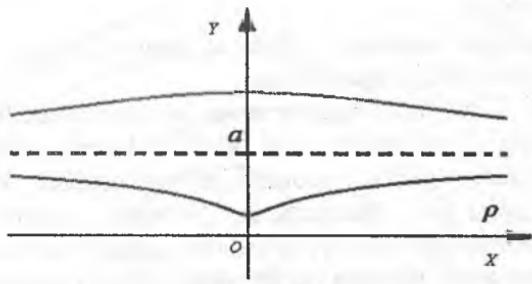

44 -chizma. Koxleoida.  $\rho = a \frac{\sin \varphi}{\varphi}$ .

### 38. Nikomend konxoidasi

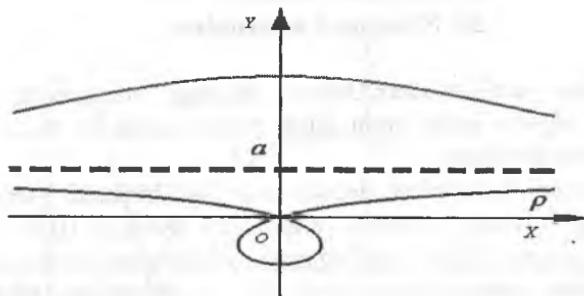

**Tarixiy ma'lumotlar.** Ushbu chiziqqa «konxoida», ya'ni «chanoqqa o'xshash» degan nom fanga yunon olimi D. Prokl (1410-485y) tomonidan kiritilgan.

Nikomed konxoidasini degan nom uni birinchi marta tahlil qilgan qadimgi yunon geometri, eramizdan avvalgi III-II asrlarda yashagan Nikomend bilan bog'lagandir. Nikomend ushbu chiziqni mexanik ravishda chiza oladigan asbob ham nashr qilgan, shuningdek chiziqning kubni ikkilashtirish hamda burchak triseksiyasi masalalarini yechimiga tadbiq qilgan.

XVII va XVIII asrlarda Nikomed konxoidasini ko'p olimlar o'rghanishgan. R. Dekart shu chiziqda o'zi kashf etgan egri chiziqqa normallar va o'rinnalar yasash usulini namoyish etgan. X. Gyuygens tomonidan konxonda va uning ba'zisi bilan chegaralangan shakl cheksiz katta yuzaga ega ekanligi ko'rsatilgan. I. Nyuton konxoidani uchinchi darajali teglamalarni geomayetrik yo'l bilan yechishga tadbiq qilgan.

2)  $a = l > 0$

$$3) l > a > 0$$

45-chizma. Nikomeda konxoidası.  $\rho = \frac{a}{\sin \varphi} + l \cdot 1), 2), 3).$

### 39. Anyezi gajagi (versyera)

**Tarixiy ma'lumotlar.** Bu chiziq yangi davr Yevropasidagi birinchi ayol matematik olim nomli bilan atalgan. Mariya Gaetana Anyezi (1718-1799yy)).

Bolonya universiteti professori oilasida tavallud topdi. Bolonya universiteti bo'lib, u 1088 yilda ochilgan.

M. Anyezi 1748 yilda «Italiya o'smirlari uchun analiz asoslari» nomli ikki tomdan iborat asarni nashr qildirdi. Asarning birinchi tomi Eylergacha bo'lgan analitik geometriyaning batafsil va ravshan bayoniga bag'ishlangan. Shuningdek, kitobda avvalroq Ferma tomonidan o'rganilgan versyera (ya'ni Anyeza gajagi) ham qaralgan.

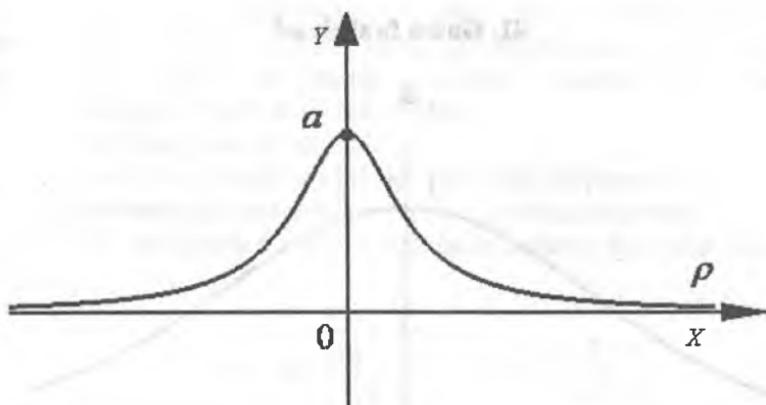

Versyera atamasini birinchi bo'lib, fanga italiya matematigi Gvido Graidi (1671-1742yy) kiritgan. U Piza universiteti professori bo'lgan, asosiy ilmiy qiziqishlari geometriyaga taluqli, xususan, maxsus silliq chiziqlarni (bargsimon egri chiziqlar yoki «atirgullar»ni) o'rgangan. Bunday chiziqlar nazariyasi G.Graidi tomonidan 1728 yilda nashr qilingan mahallada o'z ifodasini topgan.

Anyezi gajagi (versyera)ning tenglamalari (46-chizma):

1) to'g'ri burchakli koordinatalar sistemasida:  $(x^2 + a^2)y - a^3 = 0$  ;

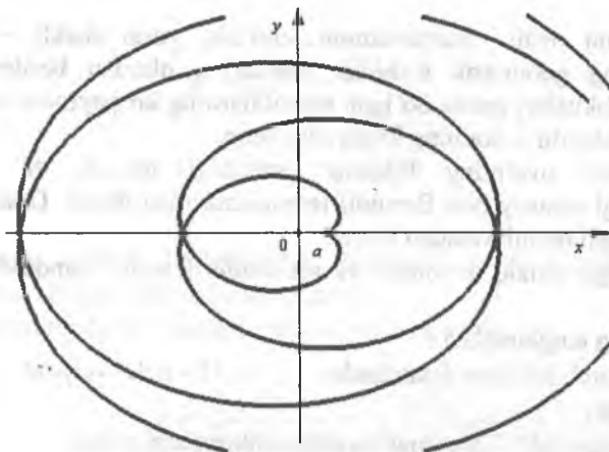

2) qutb koordinatalar sistemasida:  $\rho = \frac{a \sin^2 \varphi}{\cos \varphi}$

kabi ifodalananadi.

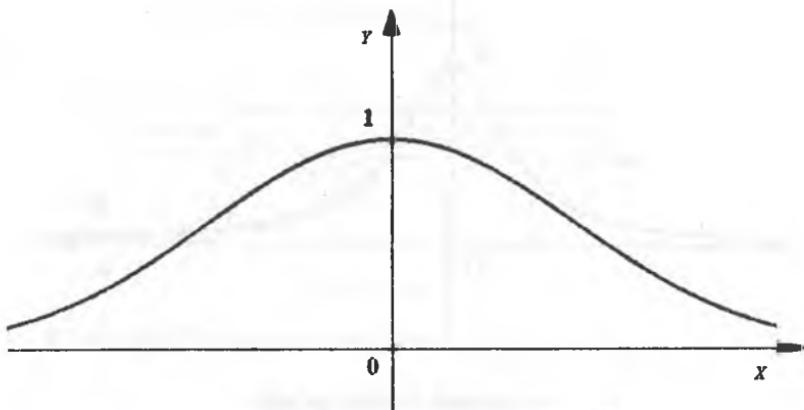

46-chizma. Anyezi gajagi.

#### 40. Aylana evolentasi (yoyunchi)

47-chizma. Aylana evolentasi (yoyunchi).  
 $x = a(\cos t + t \sin t)$ ,  $y = a(\sin t - t \cos t)$ .

## 41. Gauss funksiyasi

48-chizma. Gauss funksiyasi.  $y = e^{-x^2}$ .

## 42. Kassini ovali

Kassini ovali (tuxumsimon, cho'ziq, yassi shakl) – shunday nuqtalarning geometrik o'midan iboratki , ulardan berilgan ikkita nuqtalar (fokuslar) gacha bo'lgan masofalarning ko'paytmasi o'zgarmas bo'lib, qandaydir a sonning kvadratiga teng.

Kassini ovalining fokuslar orasidagi masofa  $2a$  ga teng bo'lgandagi xususiy holi Bernulli lemniskatasidan iborat. Ovalning o'qi ikkita fokusli lemniskatadan iborat.

Bu egri chiziq astronom va muxandis Kassini tomonidan o'ylab topilgan.

Uning tenglamalari :

1) to'g'ri burchakli koordinatalarda  $(x^2 + y^2)^2 - 2c^2(x^2 - y^2) = a^4 - c^4$

ko'rinishga ;

2) to'g'ri burchakli koordinatalardagi oshkor tenglamasi

$$y = \pm \sqrt{a^4 + 4c x^2 - x^2 - c^2}$$

ko'rinishga ;

3) qutb koordinatalari sistemasida

$$\rho^4 - 2c^2 \rho^2 \cos 2\varphi = a^4 - c^4$$

ko'rinishga ega.

Egri chiziq tenglamasida ikkita o'zaro bog'liq bo'lmasagan parametrlar:  $c$  – fokuslar orasidagi masofaning yarmi va  $a$  – fokuslardan egri chiziqning ixtiyoriy nuqtasigacha bo'lgan masofalarning ko'paytmasi ishtirok etadi.

U quyidagi xossalarga ega :

- Kassini ovali – to'rtinchli tartibli algebraik egri chiziqdan iborat ;
- u fokuslar orasidagi kesmaning o'rtasiga nisbatan simmetrikdir ;
- $0 < a \leq c\sqrt{2}$  bo'lganda ikkita absolyut maksimum va ikkita minimumga ega :

$$x = \pm \frac{\sqrt{4c^4 - a^4}}{2c}, y = \pm \frac{a^2}{2c}$$

Uning absolyut maksimum va minimum nuqtalarining geometrik o'rni – markazi fokuslar orasidagi kesmaning o'rtasida va radiusi s bo'lgan aylanadan iborat.

- $-c < a \leq c\sqrt{2}$  bo'lganda egri chiziq to'rtta egilish nuqtalariga ega.  
Ularning qutb koordinatalari :

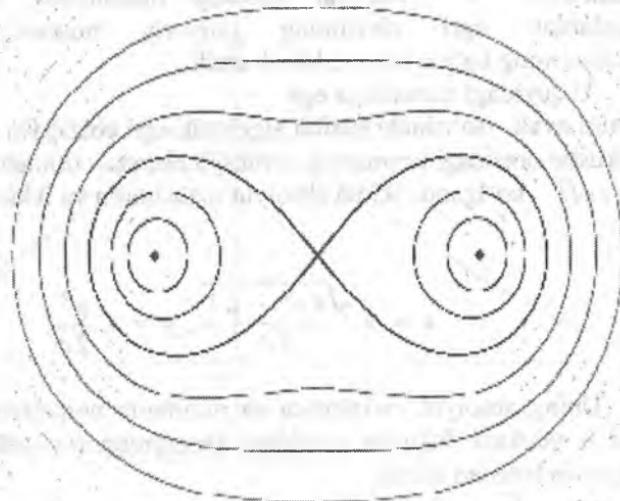

$$\begin{cases} \rho = \sqrt[4]{\frac{a^4 - c^4}{3}} \\ \cos 2\varphi = -\sqrt{\frac{1}{3}\left(\frac{a^4}{c^4} - 1\right)} \end{cases}$$

Uning egilish nuqtalarining geometrik o'rni – uchlari  $(0; \pm c)$  nuqtalarda bo'lgan lemniskatadan iborat.

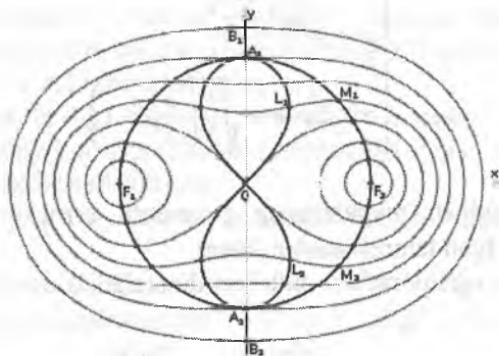

Ovalning egrilik radiusi qutb koordinatalarida

$$R = \frac{a^2 \rho}{\rho^2 + c^2 \cos 2\varphi} = \frac{2a^2 \rho^3}{c^4 - a^4 + 3\rho^4}$$

formula orqali ifodalanadi.

49-chizma. Kassini ovali.

50-chizma. Kassini ovali. Aylanada maksimum va minimumlar to‘plami,(2)- lemniskatada esa egilish nuqtalari to‘plami ko‘rsatilgan.

### 43. Kvadratriska

Kvadratriska - tekis transsendet egri chiziq bo‘lib, Proklning yozishiga ko‘ra, Gippiy (e.a. V asr) tomonidan ochilgan va qadim zamonlarda doira kvadraturasi va burchak triseksiyasi masalalarini yechishda undan foydalanilgan.

Egri chiziqning tenglamalari :

1) qutb koordinatalar sistemasida

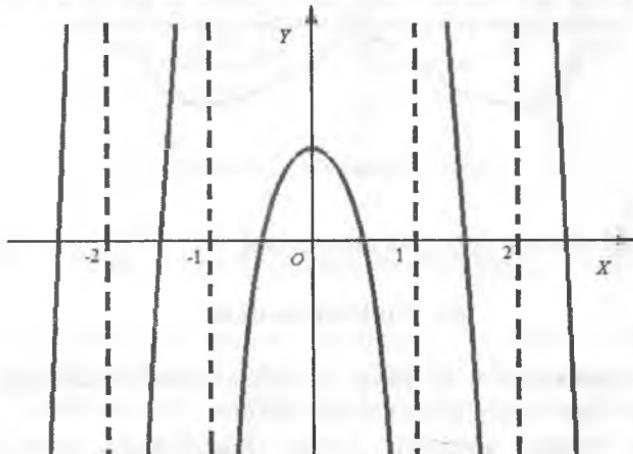

$$\rho = \frac{2R\varphi}{\pi \sin \varphi}$$

ko'rinishda ;

2) to'g'ri burchakli koordinatalar sistemasida esa,

$$x = y \operatorname{ctg} \frac{\pi y}{2R}$$

ko'rinishida yoziladi.

51-chizma. Kvadratrisa.  $x = y \operatorname{ctg} \frac{\pi y}{4}$

#### 44. Jerono lemniskatasi

Jerono lemniskatasi – ushbu

$$x^4 = a^2(x^2 - y^2)$$

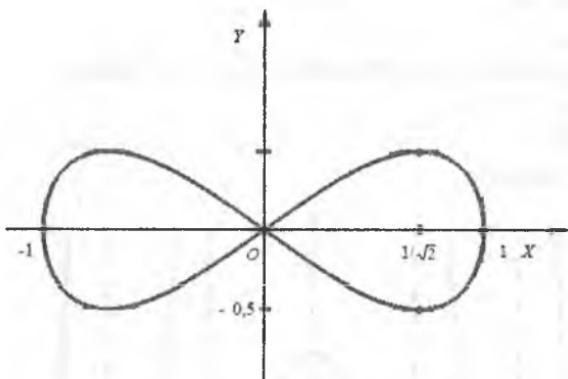

tenglamani qanoatlantiruvchi tekis egri chiziqdan iborat bo'lib, uning xossalari XIX asr boshida o'rgangan fransuz matematig K.-K. Jerono nomi bilan ataladi.

Uning tenglamasini

$$y = \pm \sqrt{\frac{a^2 x^2 - x^4}{a^2}}$$

ko'rinishda ham yozish mumkin.

Jerono lemniskatasining parametrik ko'rinishidagi tenglamasi quyidagicha :  $x = \cos \varphi$ ,  $y = \sin \varphi \cos \varphi$

52-chizma. Jerono lemniskatasi,  $x^4 - x^2 + y^2 = 0$ .

#### 45. But lemniskatasi

But lemniskatasi – to'rtinchi tartibli algebraik tekis egri chiziq bo'lib, Persey egri chizig'inining xususiy holidir.

Uning to'g'ri burchakli Dekart koordinatalar sistemasidagi tenglamasi

$$(x^2 + y^2)^2 - (2m^2 + c)x^2 + (2m^2 - c)y^2 = 0$$

ko'rinishga ega.

Egri chiziqning shakli  $m$  va  $c$  parametrlar orasidagi munosabatga bog'liq. Agar  $c > 2m^2$  bo'lsa, lemniskata tenglamasi

$$(x^2 + y^2)^2 = a^2 x^2 + b^2 y^2$$

ko'rinishni oladi, bunda  $a^2 = 2m^2 + c$  va  $b^2 = c - 2m^2$ .

Agar  $c < 2m^2$  bo'lsa, lemniskata tenglamasi

$$(x^2 + y^2)^2 = a^2 x^2 - b^2 y^2$$

ko'rinishni oladi, bunda  $a^2 = 2m^2 + c$  va  $b^2 = c - 2m^2$ .

Xususiy hollari:

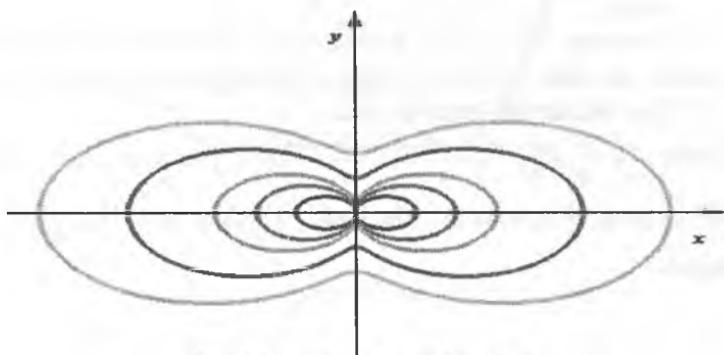

1. Agar  $c = 2m^2$  bo'lганда, But lemniskata ikkita

$$x^2 + y^2 \pm 2mx = 0$$

aylanaga aylanadi.

2. Agar  $c=0$  bo'lganda, u Bernulli lemniskatasi aylanadi.  
Uning qutb koordinatalar sistemasidagi tenglamasi

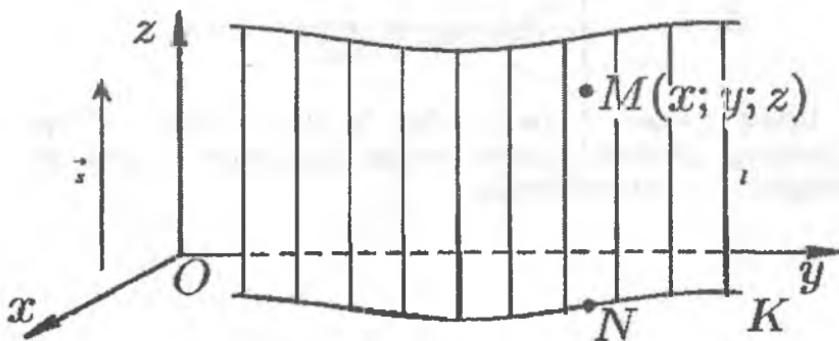

$$\rho^2 = a^2 \cos^2 \varphi + b^2 \sin^2 \varphi$$

53-chizma. But lemniskatasi.

#### 46. $R^3$ fazoda ikkinchi tartibli sirtlar

**46.1. Silindrik sirtlar.** Berilgan  $\vec{s}$  vektor yo'nalishiga parallyelligicha qolib, berilgan  $\kappa$  chiziqni kesadigan to'g'ri chiziqlar to'plami **silindirik sirt** deyiladi (54- chizma ). Bunda  $\kappa$  chiziq silindirlilik sirtning yo'naltiruvchisi,  $\vec{s}$  vektorga parallel  $\iota$  chiziqlar silindirik sirtining yasovchilari deyiladi.

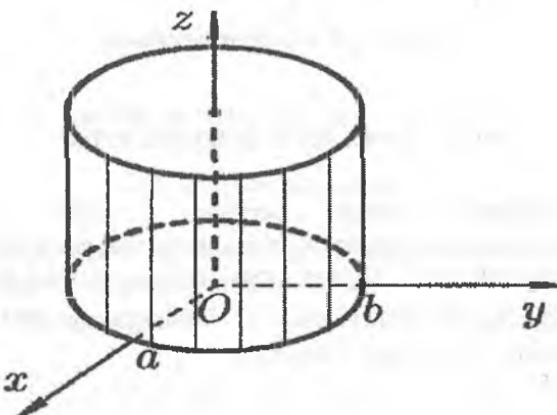

54- chizma.

**Silindr** – biror egri chiziqning nuqtalaridan o‘tuvchi parallel to‘g‘ri chiziqlar hosil qiladigan sirtdan iborat. Agar  $Oz$  silindrning yasovchisi deb qabul qilinsa, silindrik sirt  $F(x,y)=0$  tenglana orqali berilishi mumkin.

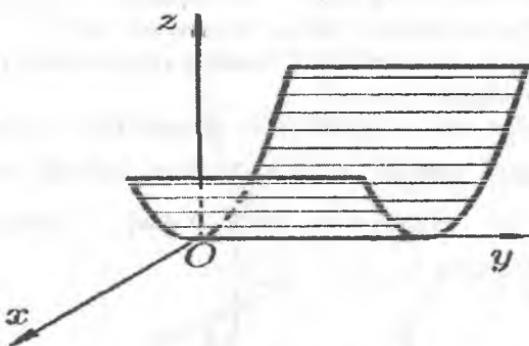

Agar sirtning  $F(x,y,z)=0$  tenglamasida qandaydir o‘zgaruvchi qatnashmasa, bu sirt, yashovchi qatnashmayotgan o‘zgaruvchi o‘qiga parallel bo‘lgan silindr dan iborat bo‘ladi.

Ushbu  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ ,  $\frac{x^2}{a^2} + \frac{z^2}{b^2} = 1$ ,  $\frac{z^2}{a^2} + \frac{y^2}{b^2} = 1$  tenglamalar, elliptik silindrik sirtning tenglamalari deyiladi. 55-chizmada  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$  sirt tasvirlangan.

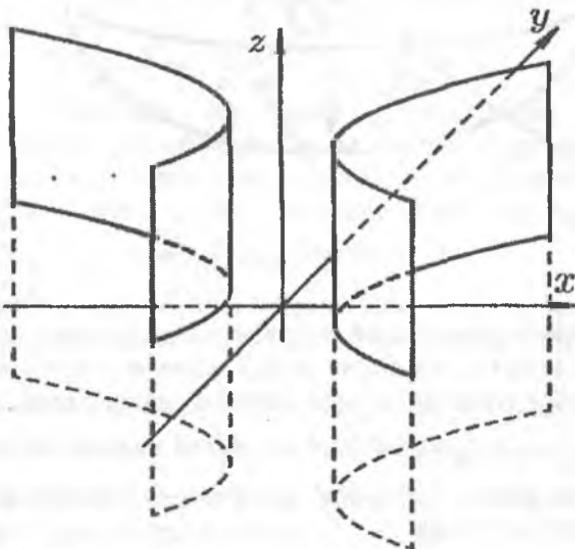

$$55\text{-chizma. } \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1.$$

Ushbu  $y^2 = 2px$ ,  $x^2 = 2pz$ ,  $z^2 = 2px$ ,  $y^2 = 2pz$ ,  $z^2 = 2py$ ,  $x^2 = 2py$  tenglamalarga parabolik silindrik sirtning tenglamalari deyiladi. 56-chizmada  $x^2 = 2pz$  sirt tasvirlangan.

56-chizma.  $x^2 = 2pz$ .

Ushbu  $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ ,  $-\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ ,  $\frac{x^2}{a^2} - \frac{z^2}{b^2} = 1$ ,  $-\frac{x^2}{a^2} + \frac{z^2}{b^2} = 1$ ,  $\frac{z^2}{a^2} - \frac{y^2}{b^2} = 1$   
 $-\frac{z^2}{a^2} + \frac{y^2}{b^2} = 1$  tenglamalarga giperbolik silindrik sirtning tenglamalari  
deyliladi. 57-chizmada  $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$  sirt tasvirlangan.

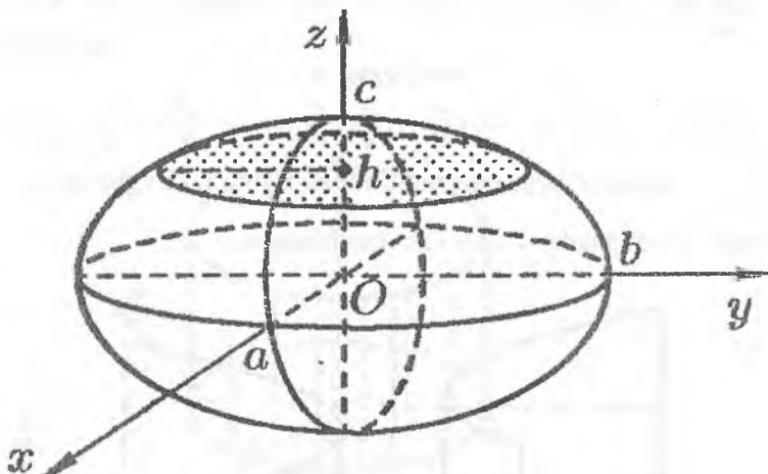

57-chizma.  $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ ,

**46.2. Aylanma sirtlar.** Biror tekis  $L$  chiziqning  $\ell$  o‘qi atrofida aylanishidan hosil bo‘lgan nuqtalar to‘plami *aylanma sirt* deyiladi.

**Ellipsoid.** Ellipsning simmetriya o‘qi atrofida aylantirishidan hosil bo‘lgan aylanma sirtga *ellipsoid* deyiladi.

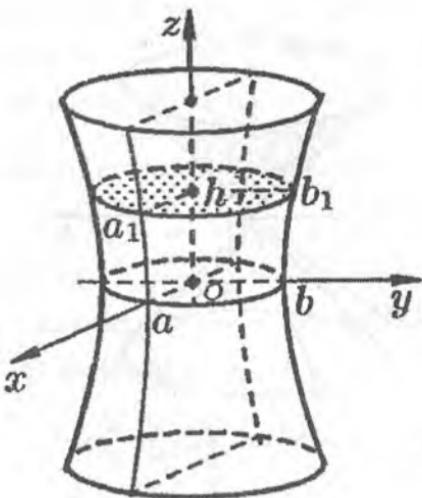

*Ellipsoid* – tenglamasini o‘zgaruvchilar almashtirish yordamida  $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$  ko‘rinishga keltirish mumkin bo‘lgan ikkinchi tartibli sirtdan iborat, bunda  $a, b, c$  – ellipsoidning yarim o‘qlari. 58-chizmada  $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$  sirt tasvirlangan.

$$58\text{-chizma. } \frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$$

**Bir pallali giperboloid.** Giperbolaning mavhum o‘q atirofida aylanishidan hosil bo‘lgan sirt *bir pallali aylanma giperboloid* deyiladi.

*Bir pallali geperboloid* – tenglamasi o‘zgaruvchilarni almashtirish yordamida  $\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1$  ko‘rinishga keltirish mumkin bo‘lgan ikkinchi tartibli sirtdan iborat. Uning o‘qi – oldida «» (manfiy) ishora turgan o‘zgaruvchiga mos keladi.

$$59\text{-chizma. } \frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1.$$

Ushbu

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1, \quad \frac{x^2}{a^2} - \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1, \quad -\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1 \quad (1)$$

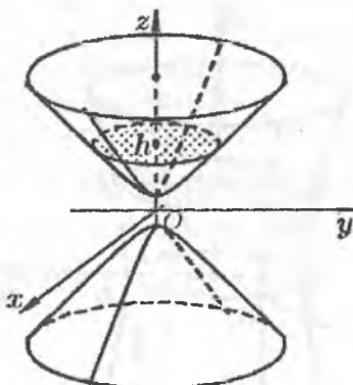

ko‘rinishdagi tenglamaga bir pallali giperboloidning kanonink tenglamasi deyiladi. Koordinatalar boshi bir pallali giperboloidning markazi, (1) tenglama uchun  $a$  va  $b$  sonlar, bir pallali giperboloidning haqiyiqiy yarim o‘qlari,  $c$  esa, mavhum yarim o‘qi deyiladi. 59-chizmada  $\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1$  sirt tasvirlangan.

**Ikki pallali giperboloid.** Giperbolani o‘zining haqiqiy o‘qi atrofida aylanishidan hosil bo‘lgan sirt, *ikki pallali aylanma giperboloid* deyiladi.

*Ikki pallali giperboloid* — tenglamasini, o‘zgaruvchilarni almashtirish yordamida,  $\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = -1$  ko‘rinishga keltirish mumkin bo‘lgan ikkinchi tartibli sirtdan iborat. Uning o‘qi — oldida «» (manfiy) ishora turgan o‘zgaruvchiga mos keladi. Ushbu

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1, \quad -\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1, \quad -\frac{x^2}{a^2} - \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$$

ko‘rinishdagi tenglama, ikki pallali giperboloidning kanonik tenglamasi deyiladi. 60-chizmada  $\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = -1$  sirt tasvirlangan.

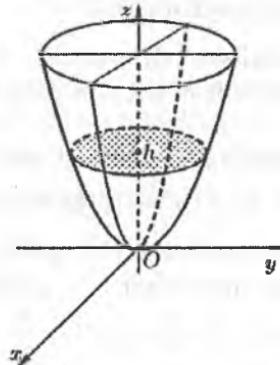

$$60\text{-chizma. } \frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = -1.$$

**Elliptik paraboloid.** Paraboloidlarning o‘z o‘qlari atirofida aylanishdan hosil bo‘lgan aylanma sirt *yeliptik paraboloid* deyiladi.

*Elliptik paraboloid* – tenglamasini almashtirish yordamida  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 2z$  ko‘rinishga keltirish mumkin bo‘lgan ikkinchi tartibli sirtdan iborat. To‘g‘riburchakli dekart koordinatalari sistemasida

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 2z, \quad \frac{y^2}{a^2} + \frac{z^2}{b^2} = 2x, \quad \frac{x^2}{a^2} + \frac{z^2}{b^2} = 2y$$

tenglama bilan tasvirlangan sirt *elliptik paraboloid* deyiladi. 61-chizmada  $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 2z$  sirt tasvirlangan.

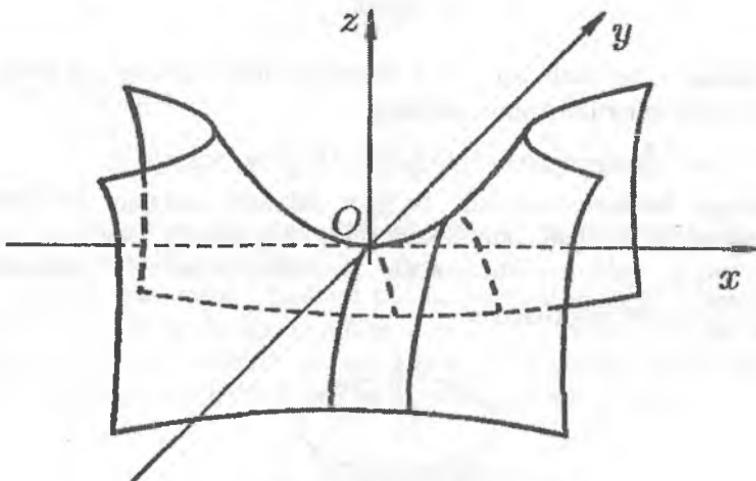

$$61\text{-chizma. } \frac{x^2}{a^2} + \frac{y^2}{b^2} = 2z.$$

**Giperbolik paraboloid (egar)** – tenglamasini o‘zgaruvchilarni almashtirish yordamida  $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 2z$  ko‘rinishga keltirish mumkin bo‘lgan ikkinchi tartibili sirtdan iborat. U  $z=0$  koordinatalar tekisligini ikkita  $bx - ay = 0$  va  $bx + ay = 0$  to‘g‘ri chiziqlar bo‘ylab kesib o‘tadi. To‘g‘riburchakli dekart koordinatalari sistemasida

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 2z, \quad \frac{y^2}{a^2} - \frac{z^2}{b^2} = 2x, \quad \frac{x^2}{a^2} - \frac{z^2}{b^2} = 2y,$$

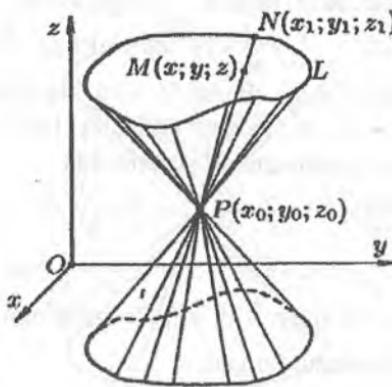

$$-\frac{x^2}{a^2} + \frac{y^2}{b^2} = 2z, \quad -\frac{y^2}{a^2} + \frac{z^2}{b^2} = 2x, \quad -\frac{x^2}{a^2} + \frac{z^2}{b^2} = 2y,$$

tenglama bilan tasvirlangan sirt eliptik paraboloid deyiladi. 62-chizmada  $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 2z$  sirt tasvirlangan.

$$62\text{-chizma. } \frac{x^2}{a^2} - \frac{y^2}{b^2} = 2z.$$

**46.3. Konus sirtlar.** Fazoda biror qo‘zg‘olmas  $P(x_0, y_0, z_0)$  nuqtadan o‘tib, berilgan  $L$  chiziqni kesuvchi  $\iota$  chiziqning harakatidan hosil bo‘lgan sirt **konus sirt** deyiladi (63-chizma).  $P(x_0, y_0, z_0)$  nuqta konus sirtining uchi,  $L$  chiziq uning yo‘naltiruvchisi,  $\iota$  to‘g‘ri chiziq esa, konus sirtining yasovchisi deyiladi.

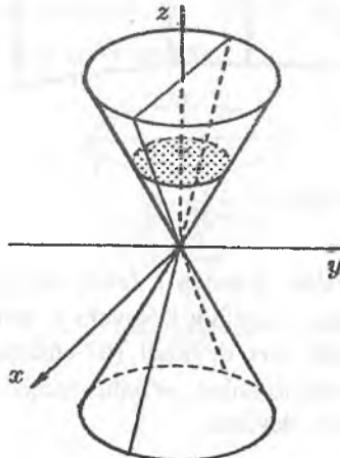

63-chizma.

**Konus** – bir jinsli  $F(x, y, z) = 0$  tenglama orqali beriladigan sirtdan iborat. Ikkinci tartibli konus quyidagi

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 0, -\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 0, \frac{x^2}{a^2} - \frac{y^2}{b^2} + \frac{z^2}{c^2} = 0$$

ko‘rinishga keltirish mumkin bo‘lgan ikkinchi darajali bir jinsli tenglama orqali beriladi, bunda konusning o‘qi manfiy kvadratga mos kelib, uning uchi – kordinatalar boshida yotadi. 64-chizmada  $\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 0$  sirt tasvirlangan.

64-chizma.  $\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 0$ .

**Tor.** Tor – yasovchi aylananing shu aylana tekisligida yotuvchi o‘qi atrofida aylanishidan hosil bo‘lgan aylanish sirtidan iborat.

Tenglamalari

Parametrik tenglamasi:

$$\begin{cases} x(\varphi, \psi) = (R + r \cos \varphi) \cos \psi \\ y(\varphi, \psi) = (R + r \cos \varphi) \sin \psi \\ z(\varphi, \psi) = r \sin \varphi \end{cases}$$

bunda ,  $\varphi, \psi \in [0, 2\pi]$ ,  $R$  – yasovchi aylana markazidan aylanish o‘qigacha bo‘lgan masofa,  $r$  – yasovchi aylananing radiusi.

Algebraik tenglamasi.

$$(x^2 + y^2 + z^2 + R^2 - r^2)^2 - 4R^2(x^2 + y^2) = 0$$

Tor – to‘rtinchı tartibli sirtdan iborat. 65-chizmada

$$\begin{cases} x(\varphi, \psi) = (3 + \cos \varphi) \cos \psi \\ y(\varphi, \psi) = (3 + \cos \varphi) \sin \psi \\ z(\varphi, \psi) = \sin \varphi \end{cases}$$

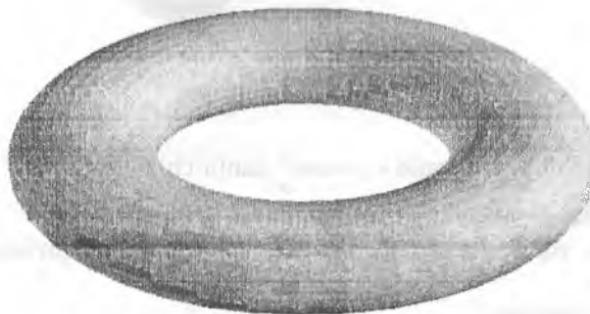

sirt tasvirlangan.

Xossalari.

1. Tor sirtning yuzi:  $S = 4\pi^2 Rr$  (Guldining 1 – teoremasidan kelib chiqadi).

2. Tor bilan chegaralangan jismning hajmi  $V = 2\pi^2 Rr^2$  (Guldining 2 – teoremasidan kelib chiqadi).

Torsimon sirt dastlab qadimgi yunon matematigi Arxit tomonidan kubni ikkilantirish massasini yechishda qaralgan. Boshqa qadimgi yunon matematigi Persey smetrik chiziqlar torni uning o‘qiga paralel tekislik bilan kesganda hosil bo‘ladigan chiziqlar haqida kitob yozadi.

65-chizma.

**Gelikoida.** Gelikoid – to‘g‘ri chiziqning unga perpendikulyar o‘q atrofida va bir vaqtning o‘zida, shu o‘q yo‘nalishida ilgarilab, harakat qilishi natijasida (bunda harakatlarning tezliklari o‘zaro proporsional) hosil bo‘ladigan sirtdan iborat.

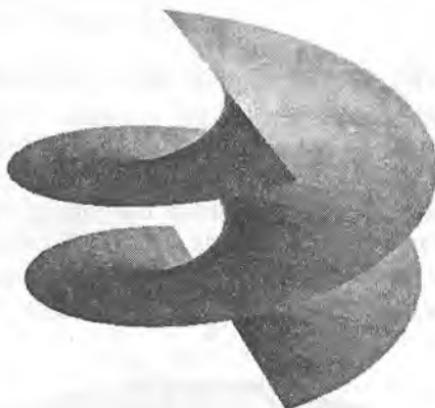

Uning parametrik tenglamasi

$$\begin{cases} x = u \cos v, \\ y = u \sin v, \\ z = hv \end{cases}$$

ko‘rinishda bo‘ladi. 66- chizmada  $\begin{cases} x = u \cos v, \\ y = u \sin v, \\ z = hv \end{cases}$  sirt tasvirlangan.  
:

Xossalari:

1. U minimal sirtdan iborat
2. U chiziqlimon sirtdir.

66- chizma.

**Katenoid.** Katenoid –  $y = a \operatorname{ch} \frac{x}{a}$  zanjir chiziqning  $Ox$  o‘q atrofida aylanishdan hosil bo‘lgan sirtdan iborat.

Uni parametrik koordinatalari yordamida, quyidagicha berish mumkin:

$$\begin{cases} x = ch(u)\cos(v), \\ y = ch(u)\sin(v), \\ z = u, \end{cases} \quad u \in R, v \in [0, 2\pi].$$

Katenoid 1744 yilda L.Eyler topib yechilgan (catena – zanjir, eidos - ko'rinish).

Katenoidning uncha katta bo'lмаган qismini izometrik ravishda (siqmasdan va cho'zmasdan) gelikoidning qismiga o'zgartirish mumkin, va aksincha
